ABSTRACT

Introduction

Sports-related dystonia, also called the yips, are often seen in athletes in multiple sports. In this condition, an athlete abruptly loses the ability to perform a repetitive motion performed thousands of times. Such occurrences are often assumed to be psychological in nature and thus evaluation for other causes is often lacking. All reviews on the topic have failed to focus on athletes in overhand sports. This scoping review will evaluate the available evidence regarding upper extremity focal dystonias (yips) in athletes participating in overhand sports.

Methods and analysis

A robust search using the Arksey and O'Malley framework will be conducted utilizing the following databases: Medline (Ovid), SportDiscus (Ebscohost), APA PsycInfo (Ebscohost), Embase (Elsevier), Web of Science Core Collection (Clarivate), Sports Medicine & Education Index (ProQuest), and Dissertations and Theses Global (ProQuest). Three persons will participate in screening titles and abstracts using criteria for dystonia/yips in athletes in overhand sports. Full text articles will then be independently reviewed. Brief descriptive analysis of eligible studies will include context on prevalence, etiology, and treatment.

Ethics and dissemination

As this describes a scoping protocol, ethical approval is not necessary. Review findings will be submitted to peer-reviewed publications and presentations at local and national conferences.

Registration

This protocol is registered with the Open Science Framework.

BMJ Open: first published as 10.1136/bmjopen-2024-091016 on 25 February 2025. Downloaded from http://bmjopen.bmj.com/ on June 14, 2025 at Agence Bibliographique de l Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

- The review with meet the need for a comprehensive mapping of the limited amount of evidence for the yips in athletes of overhand sports.
- This review of the current knowledge on the topic will drive future research endeavors to assist athletes and support staff to better understand and address the yips.
- The review is limited by the lack of definitive diagnostic criteria for the yips, potentially leading to a selection bias in existing literature on the topic.
- A reporting bias in the literature may also be present given a prevailing stigma against addressing it among athletes.

INTRODUCTION

Sports-related focal dystonia, or the yips, are a condition seen in athletes where a repetitive motion performed thousands of times is abruptly lost. Examples of this occur in many sports, including tennis, archery, running, cricket, volleyball, and table tennis, but the most common examples are putting in golf and throwing a baseball. Fine motor control of the movement is sporadic and leads to the inability to accurately perform the previous function. This is thought to be a psycho-neuromuscular disorder, with the prevailing theory among athletes being that it is a form of performance anxiety (1-6). However, many smaller studies performed on the condition in golfers show a fine motor neuromuscular dystonia as the most likely cause (2, 7). The symptoms are frequently more consistent with a fine motor dystonia, where there is an involuntary co-contraction of opposing muscle groups in the affected extremity.

There have not been many studies conducted on the yips. Of the existing literature, the yips in golf is by far the most commonly studied context of the condition (7-13). These studies have shown a correlation of the following with the yips: perfectionistic tendencies, social anxiety, performance anxiety (4), male gender, prior smoking, more experience playing golf (14), more frequent musculoskeletal problems, and a family history of the yips. Evaluations of the yips in other sports have shown that those with an overcommitment to baseball (15), previous psychological trauma, anxiety, experiencing a negative stigma from other players and coaches, increased pressure from coaches, and female gender (1) make an athlete more likely to experience the yips.

One particular study by Sato (1) explored the yips in 242 Division I college athletes. The survey was given to athletes in many different sports but showed an incidence of 13.2% of athletes who had experienced the yips. The yips were more common in studied women, as well as with athletes engaging in softball and swimming. While very informative, this study had a small number of athletes in overhand sports. The primary remaining studies on the yips were in baseball players, largely conducted in Japan (15-17), and mostly evaluated psychological causes.

Mine et al. conducted a systematic review on the effectiveness of management on "the yips in sport" in 2018 (9). Their review primarily included articles about the yips in golf, and included only one study on an overhand sport (basketball) and included many fewer studies than did Nijenhuis et al.'s review of treatments for task-specific dystonias in sports in 2024 (18). Nijenhuis' paper not only focused exclusively on treatment, but only included four individuals with dystonia who played an overhand sport (baseball and tennis). None of these reviews looked exclusively at sports with overhand motions.

Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies

Given that the prevailing amount of scientific literature about the yips has focused on golfers, information about the overhand motion of athletes in various other sports is lacking. The research question leading to this scoping review is: what is the available evidence regarding prevalence, etiology, and treatment of upper extremity focal dystonias (yips) in athletes participating in overhand sports?

METHODS AND ANALYSIS

We will conduct our scoping review with guidance from the latest version of the *JBI Manual for Evidence Synthesis* (19). Utilizing the framework as outlined by Arksey and O'Malley, we will conduct our scoping review with Arksey's five stages: 1) identifying the research question, 2) identifying relevant studies, 3) study selection, 4) charting the data and 5) collating, summarizing, and reporting the results (20). For transparency and reproducibility, we will adhere to the PRISMA reporting guidelines for scoping reviews and searches (21, 22).

We organized our research question to JBI's mnemonic, PCC (19):

Participants: Athletes that participate in overhand sports

Concept: Upper extremity focal dystonias or yips Context: Any worldwide clinical or sports setting

Inclusion criteria

Participants: Athletes that play overhand sports, such as: Baseball, softball, tennis, football, cricket, basketball, darts, volleyball, football, javelin, badminton, lacrosse, swimming, water polo, pickle ball, squash, racquetball, dodgeball, axe throwing, and jai alai.

Concept: Upper extremity focal dystonias or yips, including diagnostic criteria, interventions, or outcomes

Context: Any worldwide clinical or sports setting

Study types: All primary or secondary research studies

Exclusion criteria

Participants: Athletes that play sports with no or rare overhand motion such as golf, soccer, archery, hockey, bocci, bowling, cornhole, ladder ball, shot put, hammer throw, discus, Frisbee, or juggling.

A search for existing evidence reviews or protocols on the topic was conducted in PubMed, PsycINFO, SPORTDiscus, Cochrane Library, Epistemonikos, EPPI Centre Systematic Reviews, International HTA database, JBI Evidence Synthesis, International Journal of Evidence-based Healthcare, Campbell Systematic Reviews, PROSPERO, Open Science Framework, FigShare, and Preprint Citation Index (Web of Science) on February 29, 2024. No reviews or protocols directly addressed our research question.

Literature searching

A librarian will develop the search strategies using a combination of keywords and database subject headings for the primary databases (MEDLINE Ovid) from sentinel studies and team feedback, then translate the strategy to the other selected databases. Library colleagues will peer review the strategy

BMJ Open: first published as 10.1136/bmjopen-2024-091016 on 25 February 2025. Downloaded from http://bmjopen.bmj.com/ on June 14, 2025 at Agence Bibliographique de l Enseignement Superieur (ABES).

data mining, Al training, and similar technologies

Protected by copyright, including for uses related to text and

according to PRESS guidelines (23). Citation management and duplicate detection and removal will be accomplished with EndNote (Clarivate Analytics.)

Databases will include Medline (Ovid) 1946-2024, SportDiscus (Ebscohost) 1800-2024, APA PsycInfo (Ebscohost) 1872-2024, Embase (Elsevier) 1974-2024, Web of Science Core Collection (Clarivate) 1900-2024, Sports Medicine & Education Index (ProQuest) 1970-2024, and Dissertations and Theses Global (ProQuest) 1861-2024. No date limits, nor methodological filters will be used.

Other sources:

References of included studies will be checked for additional relevant studies.

Grey literature: Conference proceedings and abstracts for years from 2017 to 2024, as they have publicly available meeting abstracts available for review:

- American Academy of Neurology (https://www.aan.com/)
- Movement Disorder Society (https://www.movementdisorders.org/)

Study Selection (eligibility criteria)

Two reviewers from a pool of three will independently screen each title and abstract, then independently review full text in duo for inclusion. When no consensus can be reached between the two reviewers, a third reviewer will be the deciding vote. We will use Covidence (Veritas Health Innovation), an online systematic reviewing platform, to screen and select studies.

Quality assessment

In compliance with scoping review methodology, no quality assessment of included studies will be conducted, as our goal is to rapidly map the literature.

Data extraction:

Two reviewers will pilot our data charting form using sentinel articles prior to finalization of protocol. Three reviewers will then independently extract and chart the data from included studies using Covidence.

We will chart the following data:

- Title
- Year of publication
- Context:
 - Origin/country of origin (where the source was published or conducted)
 - Clinical or sports setting
- Aims/purpose
- Participants: Population and sample size within the source of evidence (if applicable)
- Methodology / methods
 - Study Type
- Concept:
 - o Diagnostic criteria
 - o Intervention type, comparator and details of these (e.g. duration of the intervention) (if applicable). Duration of the intervention (if applicable)
 - Outcomes and details of these (e.g. how measured) (if applicable)

data mining, Al training, and similar technologies

Protected by copyright, including for uses related to text and

Key findings that relate to the scoping review question/s.

Analysis of evidence:

Analysis will include frequency counts of populations, characteristics, and demographics. Brief descriptive analysis will include context on prevalence, etiology, and treatment.

Presentation of results:

Results will be presented in both tabular and narrative form.

Limitations

This review is limited by the lack of definitive diagnostic criteria for the yips, potentially leading to a selection bias in existing literature on the topic. A reporting bias in the literature may also be present given a prevailing stigma against addressing it among athletes.

ETHICS AND DISSEMINATION

As this is a review protocol, no ethical approval is necessary. Results will be submitted to a peer-reviewed journal for publication and submitted to both local and national conferences. Any changes from the scoping protocol methodology will be acknowledged and defined in the manuscript.

Publication plan for protocol: This protocol is registered with the Open Science Framework (osf.io).

ABSTRACT

Introduction

Sports-related dystonia, also called the yips, are often seen in athletes in multiple sports. In this condition, an athlete abruptly loses the ability to perform a repetitive motion performed thousands of times. Such occurrences are often assumed to be psychological in nature and thus evaluation for other causes is often lacking. All reviews on the topic have failed to focus on athletes in overhand sports. This scoping review will evaluate the available evidence regarding upper extremity focal dystonias (yips) in athletes participating in overhand sports in any worldwide clinical or sport setting.

Methods and analysis

We will conduct our scoping review with guidance from the latest version of the *JBI Manual for Evidence Synthesis*. We organized our research question and inclusion criteria to the JBI's mnemonic, Participants: Athletes that participate in overhand sports, Concept: Upper extremity focal dystonias or yips, and Context: Any worldwide clinical or sports setting.

Search results were retrieved on June 26-27, 2024, in the following databases: Medline (Ovid) 1946-2024, SportDiscus (Ebscohost) 1800-2024, APA PsycInfo (Ebscohost) 1872-2024, Embase (Elsevier) 1974-2024, Web of Science Core Collection (Clarivate) 1900-2024, Sports Medicine & Education Index (ProQuest) 1970-2024, and Dissertations and Theses Global (ProQuest) 1861-2024. Using Covidence, two reviewers from a team of three will independently screen titles and abstracts, screen full text articles for inclusion, and independently extract data from our included studies. Results will be presented as narrative descriptive analysis along with tabular data on the prevalence, diagnostic criteria, and treatment for yips in athletes of overhand sports.

Ethics and dissemination

As this describes a scoping protocol, ethical approval is not necessary. Review findings will be

submitted to peer-reviewed publications and presentations at local and national conferences.

- The review with meet the need for a comprehensive mapping of the limited amount of evidence for the yips in athletes of overhand sports.
- This review of the current knowledge on the topic will drive future research endeavors to assist athletes and support staff to better understand and address the yips.
- A reporting bias in the literature may be present given a prevailing stigma against addressing it among athletes.

INTRODUCTION

Sports-related focal dystonia, or the yips, are a condition seen in athletes where a repetitive motion performed thousands of times is abruptly lost. Examples of this occur in many sports, including tennis, archery, running, cricket, volleyball, and table tennis, but the most common examples are putting in golf and throwing a baseball. Fine motor control of the movement is sporadic and leads to the inability to accurately perform the previous function. This is thought to be a psycho-neuromuscular disorder, with the prevailing theory among athletes being that it is a form of performance anxiety [2-7]. However, many smaller studies performed on the condition in golfers show a fine motor neuromuscular dystonia as the most likely cause [3-8]. The symptoms are frequently more consistent with a fine motor dystonia, where there is an involuntary co-contraction of opposing muscle groups in the affected extremity.

There have not been many studies conducted on the yips. Of the existing literature, the yips in golf is by far the most commonly studied context of the condition [8-14]. These studies have shown a correlation of the following with the yips: perfectionistic tendencies, social anxiety, performance anxiety [5], male gender, prior smoking, more experience playing golf [15], more frequent musculoskeletal problems, and a family history of the yips. Evaluations of the yips in other sports have shown that those with an overcommitment to baseball [16], previous psychological trauma, anxiety, experiencing a negative stigma from other players and coaches, increased pressure from coaches, and female gender [2] make an athlete more likely to experience the yips.

One particular study by Sato [2] explored the yips in 242 Division I college athletes. The survey was given to athletes in many different sports but showed an incidence of 13.2% of athletes who had experienced the yips. The yips were more common in studied women, as well as with athletes engaging in softball and swimming. While very informative, this study had a small number of athletes in overhand sports.

The primary remaining studies on the yips were in baseball players, largely conducted in Japan [16-18], and mostly evaluated psychological causes.

Mine et al. conducted a systematic review on the effectiveness of management on "the yips in sport" in 2018 [10]. Their review primarily included articles about the yips in golf, and included only one study on an overhand sport (basketball) and included many fewer studies than did Nijenhuis et al.'s review of treatments for task-specific dystonias in sports in 2024 [19]. Nijenhuis' paper not only focused exclusively on treatment, but only included four individuals with dystonia who played an overhand sport (baseball and tennis). None of these reviews looked exclusively at sports with overhand motions.

б

<u>73</u>

1<u>2</u>

58

Given that the prevailing amount of scientific literature about the yips has focused on golfers,

information about the overhand motion of athletes in various other sports is lacking. The research question leading to this scoping review is: what is the available evidence regarding prevalence, etiology, and treatment of upper extremity focal dystonias (yips) in athletes participating in overhand sports? We organized our research question to JBI's mnemonic, PCC [20]:

Participants: Athletes that participate in overhand sports

Concept: Upper extremity focal dystonias or yips Context: Any worldwide clinical or sports setting

METHODS AND ANALYSIS

We will conduct our scoping review with guidance from the latest version of the *JBI Manual for Evidence Synthesis* [20]. Utilizing the framework as outlined by Arksey and O'Malley, we will conduct our scoping review with Arksey's five stages: 1) identifying the research question, 2) identifying relevant studies, 3) study selection, 4) charting the data and 5) collating, summarizing, and reporting the results [21]. For transparency and reproducibility, we will adhere to the PRISMA reporting guidelines for scoping reviews and searches [22,23]. (see Appendix I.)

A search for existing evidence reviews or protocols on the topic was conducted in PubMed, PsycINFO, SPORTDiscus, Cochrane Library, Epistemonikos, EPPI Centre Systematic Reviews, International HTA database, JBI Evidence Synthesis, International Journal of Evidence-based Healthcare, Campbell Systematic Reviews, PROSPERO, Open Science Framework, FigShare, and Preprint Citation Index (Web of Science) on February 29, 2024. No reviews or protocols directly addressed our research question.

Literature searching

A librarian will develop the search strategies using a combination of keywords and database subject headings for the primary databases (MEDLINE Ovid) from sentinel studies and team feedback, then translate the strategy to the other selected databases. Database search translation refers to database-

Appecific subject headings and search fields (e.g. article title, abstract, keywords). For example, Medline's Medical Applicated Headings (MeSH) are completely different from Embase's Emtree subject headings. Library colleagues will peer Applicated the strategy.

₹

23

26

according to PRESS guidelines [24]. Citation management and duplicate detection and removal will be accomplished with EndNote (Clarivate Analytics.)

Databases will include Medline (Ovid) 1946-2024, SportDiscus (Ebscohost) 1800-2024, APA PsycInfo (Ebscohost) 1872-2024, Embase (Elsevier) 1974-2024, Web of Science Core Collection (Clarivate) 1900-2024, Sports Medicine & Education Index (ProQuest) 1970-2024, and Dissertations and Theses Global (ProQuest) 1861-2024. No date limits, nor methodological filters will be used.

Other sources:

References of included studies will be checked for additional relevant studies.

Grey literature: We will search for dystonias or yips in conference proceedings and abstracts which are publicly available for years from 2017 to 2024, and review for designated overhand sports or athletes:

- American Academy of Neurology (https://www.aan.com/)
- Movement Disorder Society (https://www.movementdisorders.org/)

Study Selection (eligibility criteria)

Two reviewers from a pool of three (JK, KS, KBJ) will independently screen each title and abstract, then independently review full text in duo for inclusion. When no consensus can be reached through discussion between the two reviewers employing the a priori protocol, a third reviewer (KBJ) will be the deciding vote. We will use Covidence (Veritas Health Innovation), an online systematic reviewing platform, to screen and select studies, which gives reviewers the option to view criteria during selection. Our eligibility criteria are organized to JBI's mnemonic, PCC [20].

Inclusion criteria

Participants: Athletes that play overhand sports, such as: Baseball, softball, tennis, football,

cricket, basketball, darts, volleyball, football, javelin, badminton, lacrosse, swimming, water polo, pickle ball, squash, racquetball, dodgeball, axe throwing, and jai alai.

Concept: Upper extremity focal dystonias or yips, including reported diagnostic criteria, interventions,

....

outcomes

Context: Any worldwide clinical or sports setting

Study types: All primary or secondary research studies

Exclusion criteria

Participants: Athletes that play sports with no or rare overhand motion such as golf, soccer, archery, hockey, bocci, bowling, cornhole, ladder ball, shot put, hammer throw, discus, Frisbee, or

juggling.

Quality assessment

In compliance with scoping review methodology, which states "critical appraisal is not mandatory", no quality assessment of included studies will be conducted, as our goal is to rapidly map the literature [25,26].

We piloted our data charting form with two reviewers (JK, KBJ) using sentinel articles prior to finalization of protocol.

Two reviewers from a pool of three (JK, KS, KBJ) will independently extract and chart the data from included studies using

Covidence. When conflicts arise and consensus cannot be reached through discussion, the third reviewer (KBJ) will make the final decision on data charted.

We will chart the following data reported in the included studies:

- Title
- Year of publication
- Context:
 - Origin/country of origin (where the source was published or conducted)
 - Clinical or sports setting
- Aims/purpose
- Participants: Athletes that play overhand sports
 - Population characteristics, demographics, and sample size
 - Sport type
- Methodology / methods
 - Study Type
- Concept: Dystonias
 - Diagnostic criteria
 - Reported prevalence
 - Etiology
 - o Intervention, intervention type, intervention modality, intervention duration
 - o Comparator, comparator type, comparator modality, comparator duration
 - Outcomes, including outcome measurements, and outcome duration

Analysis of evidence:

Analysis will include frequency counts of population characteristics and demographics, represented in tables or graphs. Narrative descriptive analysis will include population, concept, and context, specifically reported prevalence, etiology, and treatment. We will organize our extraction to the PCC.

Patient and Public Involvement Statement: None

Presentation of results:

Results will be presented as narrative descriptive analysis along with tabular data on the prevalence, diagnostic criteria and treatment for yips in athletes of overhand sports.

Limitations

Reporting bias in the literature may be present given a prevailing stigma against addressing the yips among athletes. To mitigate publication and reporting biases, we are searching seven databases and conference proceedings from two professional organizations, in addition to including primary and secondary research studies. Unpublished results will not be included since we will not be contacting researchers, nor searching beyond our designated databases and society conferences. Our goal is to rapidly map the literature on prevalence, etiology, and treatment of upper extremity focal dystonias (yips) in athletes participating in overhand sports.

ETHICS AND DISSEMINATION

As this is a review protocol of study results, no ethical approval is necessary. Results will be submitted as a

data mining, Al training, and similar technologies

Protected by copyright, including for uses related to text

Any changes from the scoping protocol methodology will be acknowledged and defined in the manuscript.

rotocol is re_i. Registration plan for protocol: This protocol is registered with the Open Science Framework(1) (osf.io).

Appendix I: Recommended items to address in a scoping review protocol [25,27]

Section and topic	Item No	Checklist item	Page#
ADMINISTRA	TIVE INFORM	MATION	
Title:			
Identification	1a	Identify the report as a protocol of a scoping review	1
Update	1b	If the protocol is for an update of a previous scoping review, identify as such	n/a
Registration	2	If registered, provide the name of the registry (such as JBI) and registration number	1
Authors:			
Contact	За	Provide name, institutional affiliation, email address of all protocol authors; provide physical mailing address of corresponding author	1
Contributions	3b	Describe contributions of protocol authors and identify the guarantor of the review	6
Amendments	4	If the protocol represents an amendment of a previously completed or published protocol, identify as such and list changes; otherwise, state plan for documenting important protocol amendments	n/a
Support:			
Sources	5a	Indicate sources of financial or other support for the review	6
Sponsor	5b	Provide name for the review funder and/or sponsor	n/a
Role of sponsor or funder	5c	Describe roles of funder(s), sponsor(s), and/or institution(s), if any, in developing the protocol	n/a
INTRODUCTI	ON		
Rationale	6	Describe the rationale for the review in the context of what is already known (Note: Consider providing a rationale for the choice of conducting a scoping review as compared to other evidence synthesis approaches)	2
Objectives	7	Provide an explicit statement of the question(s) the review will address with reference to the inclusion/ exclusion criteria	3
METHODS			
Eligibility criteria	8	Specify the study characteristics (such as PICO, study design, setting, timeframe) and report characteristics (such as years considered, language, publication status) to be used as criteria for eligibility for the review	3-4
Information sources	9	Describe all intended information sources (such as electronic databases, contact with study authors, trial registers or other gray literature sources) with planned dates of coverage	4
Search strategy	10	Present draft of search strategy to be used for at least one electronic database, including planned limits, such that it could be repeated	3-4
Study record	s:		
Data management	11a	Describe the mechanism(s) that will be used to manage records and data throughout the review	4
Selection process	11b	State the process that will be used for selecting studies (such as two independent reviewers) through each phase of the review (that is, screening, eligibility and inclusion)	4
Data collection process	11c	Describe planned method of extracting data from reports (such as piloting forms, done independently, in duplicate), any processes for obtaining and confirming data from investigators	4-5
Data items	12	List and define all variables for which data will be sought (such as PICO items, funding sources), any preplanned data assumptions and simplifications (Note: Scoping reviews may not use PICO and instead may use JBI's Population, Concept, and Context [PCC] or another approach to reporting eligibility criteria)	4
Outcomes and prior- itization	13	List and define all outcomes for which data will be sought, including prioritization of main and additional outcomes, with rationale (Note: Scoping reviews may not extract outcome data, so this can refer to whichever data items are extracted)	5

(Continued)			
Section and topic	Item No	Checklist item	Page
Risk of bias in indi- vidual studies	14	If this is to occur, describe anticipated methods for assessing risk of bias of individual studies, including whether this will be done at the outcome or study level, or both; state how this information will be used in data synthesis (Note: Scoping reviews typically do not include risk of bias assessment, but this information should be described if it will occur)	5
Data synthesis	15a	Describe criteria under which study data will be presented (Note: Scoping reviews do not typically include quantitative synthesis of study data, but should still describe in advance how extracted data are anticipated to be presented in the resulting review)	5
	15b	Describe the planned approach to how extracted data will be presented (such as figures, tables, evidence gaps maps)	5
	15c	Describe any proposed additional analyses (such as thematic analyses) (Note: The JBI methodological guidance does not recommend undertaking thematic analysis as this synthesis of data should ideally occur following methodological appraisal of the included sources)	n/a
	15d	If quantitative synthesis is not appropriate, describe the type of summary planned	4
Meta-bias(es)	16	Specify any planned assessment of meta-bias(es) (such as publication bias across studies, selective reporting within studies) (Note: Scoping reviews typically do not include assessment of meta-bias[es], but this information should be described if it will occur)	n/a
Confidence in cumu- lative evidence	17	Describe how the strength of the body of evidence will be assessed (such as GRADE)	n/a

GRADE, Grading of Recommendations, Assessment, Development and Evaluation; PICO, participants, intervention, comparator, outcomes; PRISMA, Preferred Reporting Items for Systematic Reviews and Meta-Analyses.

ABSTRACT

Introduction

Sports-related dystonia, also called the yips, are often seen in athletes in multiple sports. In this condition, an athlete abruptly loses the ability to perform a repetitive motion performed thousands of times. Such occurrences are often assumed to be psychological in nature and thus evaluation for other causes is often lacking. All reviews on the topic have failed to focus on athletes in overhand sports. This scoping review will evaluate the available evidence regarding upper extremity focal dystonias (yips) in athletes participating in overhand sports in any worldwide clinical or sport setting.

Methods and analysis

We will conduct our scoping review with guidance from the latest version of the JBI Manual for Evidence Synthesis. We organized our research question and inclusion criteria to the JBI's mnemonic, Participants: Athletes that participate in overhand sports; Concept: Upper extremity focal dystonias or yips; and Context: Any worldwide clinical or sports setting.

Search results were retrieved on June 26-27, 2024, in the following databases: Medline (Ovid) 1946-2024, SportDiscus (Ebscohost) 1800-2024, APA PsycInfo (Ebscohost) 1872-2024, Embase (Elsevier) 1974-2024, Web of Science Core Collection (Clarivate) 1900-2024, Sports Medicine & Education Index (ProQuest) 1970-2024,

and Dissertations and Theses Global (ProQuest) 1861-2024. Using Covidence, two reviewers from a team of three will independently screen titles and

abstracts, screen full text articles for inclusion, and independently extract data from our included studies. Results will be ptesented as a narrative descriptive analysis along with tabular data on the prevalence, diagnostic criteria, and Reatment for yips in athletes of overhand sports. 48 49

Ethics and dissemination

As this describes a scoping protocol, ethical approval is not necessary. Review findings will be

56

- The review provides the first comprehensive analysis of the yips in athletes of overhand sports.
- This review of the current knowledge on the topic encompasses a broad search of multiple databases to fully assess the yips in athletes of overhand sports.
- A reporting bias in the literature may be present given a prevailing stigma against addressing the yips among athletes.

INTRODUCTION

Sports-related focal dystonia, or the yips, is a condition seen in athletes where a repetitive motion performed thousands of times is abruptly lost. Examples of this occur in many sports, including tennis, archery, running, cricket, volleyball, and table tennis, but the most common examples are putting in golf or throwing a baseball. Fine motor control of the movement is sporadic and leads to the inability to accurately perform the previous function. This is thought to be a psycho-neuromuscular disorder, with the prevailing theory among athletes being that it is a form of performance anxiety [2-7]. However, many smaller studies performed on the condition in golfers show a fine motor neuromuscular dystonia as the most likely cause [3-8]. The symptoms are frequently more consistent with a fine motor dystonia, where there is an involuntary co-contraction of opposing muscle groups in the affected extremity.

There have not been many studies conducted on the yips. Of the existing literature, the yips in golf is by far the most commonly studied context of the condition [8-14]. These studies have shown a correlation of the following with the yips: perfectionistic tendencies, social anxiety, performance anxiety [5], male gender, prior smoking, more experience playing golf [15], more frequent musculoskeletal problems, and a family history of the yips. Evaluations of the yips in other sports have shown that those with an overcommitment to baseball [16], previous psychological trauma, anxiety, experiencing a negative stigma from other players and coaches, increased pressure from coaches, and female gender [2] make an athlete more likely to experience the yips.

One particular study by Sato [2] explored the yips in 242 Division I college athletes. The survey was given to athletes in many different sports but showed an incidence of 13.2% of athletes who had experienced the yips. The yips were more common in studied women, as well as with athletes engaging in softball and swimming. While very informative, this study included only a small number of athletes in overhand sports.

The primary remaining studies on the yips were in baseball players, largely conducted in Japan [16-18], and mostly evaluated psychological causes.

Mine et al. conducted a systematic review on the effectiveness of management on "the yips in sport" in 2018 [10]. Their review primarily included articles about the yips in golf, included only one study on an overhand sport (basketball), and included many fewer studies than did Nijenhuis et al.'s review of treatments for task-specific dystonias in sports in 2024 [19]. Nijenhuis' paper not only focused exclusively on treatment, but only included four individuals with dystonia who played an overhand sport (baseball and tennis). None of these reviews looked exclusively at sports with overhand motions.

information about the overhand motion of athletes in various other sports is lacking. The research question leading to this scoping review is: what is the available evidence regarding prevalence, etiology, and treatment of upper extremity focal dystonias (yips) in athletes participating in overhand sports? We organized our research question to JBI's mnemonic, PCC [20]:

Participants: Athletes that participate in overhand sports

Concept: Upper extremity focal dystonias or vips Context: Any worldwide clinical or sports setting

METHODS AND ANALYSIS

We will conduct our scoping review with guidance from the latest version of the JBI Manual for Evidence Synthesis [20]. Utilizing the framework as outlined by Arksey and O'Malley, we will conduct our scoping review with Arksey's five stages: 1) identifying the research question, 2) identifying relevant studies, 3) study selection, 4) charting the data, and 5) collating, summarizing, and reporting the results [21]. For transparency and reproducibility, we will adhere to the PRISMA reporting guidelines for scoping reviews and searches [22,23]. (See Appendix I.)19

A search for existing evidence reviews or protocols on the topic was conducted in PubMed, PsycINFO, SPORTDiscus, Cochrane Library, Epistemonikos, EPPI Centre Systematic Reviews, International HTA database, JBI Evidence Synthesis, International Journal of Evidence-based Healthcare, Campbell Systematic Reviews, PROSPERO, Open Science Framework, FigShare, and Preprint Citation Index (Web of Science) on February 29, 2024. No reviews or protocols directly addressed the research question.

Literature searching

A librarian will develop the search strategies using a combination of keywords and database subject headings for the primary databases (MEDLINE Ovid) from sentinel studies and team feedback, then translate the strategy to the other selected databases. Database search translation refers to database-specific

sų̃bject headings and search fields (e.g., article title, abstract, keywords). For example, Medline's Medical Subject Headings (MeSH) are completely different from Embase's Emtree subject headings. Library colleagues will peer review tag strategy according to PRESS guidelines [24]. Citation management and duplicate detection and removal will be 37

accomplished with EndNote (Clarivate Analytics.)

Databases will include Medline (Ovid) 1946-2024, SportDiscus (Ebscohost) 1800-2024, APA PsycInfo (Ebscohost) 1872-2024, Embase (Elsevier) 1974-2024, Web of Science Core Collection (Clarivate) 1900-2024, Sports Medicine & Education Index (ProQuest) 1970-2024, and Dissertations and Theses Global (ProQuest) 1861-2024. No date limits, nor methodological filters will be used. (See Appendix II.)

Other sources:

References of included studies will be checked for additional relevant studies.

Grey literature: We will search for dystonias or yips in conference proceedings and abstracts which are publicly available for years from 2017 to 2024 as listed below, and review for designated overhand sports or athletes:

- American Academy of Neurology (https://www.aan.com/)
- Movement Disorder Society (https://www.movementdisorders.org/)

Study Selection (eligibility criteria)

60

Two reviewers from a pool of three (JK, KS, KBJ) will independently screen each title and abstract, then independently review full text in duo for inclusion. When no consensus can be reached through discussion between the two reviewers employing the a priori protocol, a third reviewer (KBJ) will be the deciding vote. We will use Covidence (Veritas Health Innovation),

an online systematic reviewing platform, to screen and select studies, which gives reviewers the option to view criteria during selection. Our eligibility criteria is organized to JBI's mnemonic, PCC [20].

Inclusion criteria

Participants: Athletes that play overhand sports, such as: Baseball, softball, tennis, football,

cricket, basketball, darts, volleyball, football, javelin, badminton, lacrosse, swimming, water polo, pickle ball, squash, racquetball, dodgeball, axe throwing, and jai alai.

Concept: Upper extremity focal dystonias or yips, including reported diagnostic criteria, interventions,

or

Outcomes,

Context: Any worldwide clinical or sports setting,

Study types: All primary or secondary research studies.

Exclusion criteria

Participants: Athletes that play sports with no or rare overhand motion such as golf, soccer, archery, hockey, bocci, bowling, cornhole, ladder ball, shot put, hammer throw, discus, Frisbee, or

juggling.

Quality assessment

In compliance with scoping review methodology, which states "critical appraisal is not mandatory", no quality assessment of included studies will be conducted, as our goal is to rapidly map the literature [25,26].

Data extraction:

We piloted our data charting form with two reviewers (JK, KBJ) using sentinel articles prior to finalization of protocol.

Two reviewers from a pool of three (JK, KS, KBJ) will independently extract and chart the data from included studies using

Covidence. When conflicts arise and consensus cannot be reached through discussion, the third reviewer (KBJ) will make the final decision on data charted.

We will chart the following data reported in the included studies:

- Title
- Year of publication
- Context:
 - Origin/country of origin (where the source was published or conducted)
 - Clinical or sports setting
- Aims/purpose
- Participants: Athletes that play overhand sports
 - Population characteristics, demographics, and sample size
 - Sport type
- Methodology / methods
 - Study Type
- Concept: Dystonias
 - Diagnostic criteria
 - Reported prevalence

Analysis of evidence:

Analysis will include frequency counts of population characteristics and demographics, represented in 7 Eables or graphs. Narrative descriptive analysis will include population, concept, and context, along with specifically Peported prevalence, etiology, and treatment. We will organize our extraction to the PCC framework.

Patient and Public Involvement Statement: None

Presentation of results:

Results will be presented as narrative descriptive analysis along with tabular data on the prevalence, degnostic criteria, and treatment for yips in athletes of overhand sports.

Limitations

Reporting bias in the literature may be present

given a prevailing stigma against addressing the yips among athletes. To mitigate publication and reporting biases, we are searching seven databases and conference proceedings from two professional organizations, in addition to including primary and secondary research studies. Unpublished results will not be included since we will not be contacting researchers, nor searching beyond our designated databases and society conferences. Our goal is to rapidly map the literature on prevalence, etiology,

and society conferences. Our goal is to rapidly map the interactive on prevalence, ethological distributions (yips) in athletes participating in overhand sports.

ETHICS AND DISSEMINATION

As this is a review protocol of study results, no ethical approval is necessary. Results manuscript to a peer-reviewed sports medicine journal for publication and submitted as an abstraction. As this is a review protocol of study results, no ethical approval is necessary. Results will be submitted as a ຫຼັanuscript to a peer-reviewed sports medicine journal for publication and submitted as an abstract or poster psesentation to local and national athletic training and sports medicine conferences, notably the American Medical **\$6**ciety for Sports Medicine annual meeting.

> Any changes from the scoping protocol methodology will be acknowledged and defined in the manuscript.

Registration plan for protocol: This protocol is registered with the Open Science Framework [1] (osf.io).

Appendix I: Recommended items to address in a scoping review protocol [25,27]

	I		
Section and topic	Item No	Checklist item	Page
ADMINISTRA	TIVE INFORM	IATION	
Title:			
Identification	1a	Identify the report as a protocol of a scoping review	1
Update	1b	If the protocol is for an update of a previous scoping review, identify as such	n/a
Registration	2	If registered, provide the name of the registry (such as JBI) and registration number	1
Authors:			
Contact	3a	Provide name, institutional affiliation, email address of all protocol authors; provide physical mailing address of corresponding author	1
Contributions	3b	Describe contributions of protocol authors and identify the guarantor of the review	6
Amendments	4	If the protocol represents an amendment of a previously completed or published protocol, identify as such and list changes; otherwise, state plan for documenting important protocol amendments	n/a
Support:			
Sources	5a	Indicate sources of financial or other support for the review	6
Sponsor	5b	Provide name for the review funder and/or sponsor	n/a
Role of sponsor or funder	5c	Describe roles of funder(s), sponsor(s), and/or institution(s), if any, in developing the protocol	n/a
INTRODUCTI	ON		
Rationale	6	Describe the rationale for the review in the context of what is already known (Note: Consider providing a rationale for the choice of conducting a scoping review as compared to other evidence synthesis approaches)	2
Objectives	7	Provide an explicit statement of the question(s) the review will address with reference to the inclusion/ exclusion criteria	3
METHODS			
Eligibility criteria	8	Specify the study characteristics (such as PICO, study design, setting, timeframe) and report characteristics (such as years considered, language, publication status) to be used as criteria for eligibility for the review	3-4
Information sources	9	Describe all intended information sources (such as electronic databases, contact with study authors, trial registers or other gray literature sources) with planned dates of coverage	4
Search strategy	10	Present draft of search strategy to be used for at least one electronic database, including planned limits, such that it could be repeated	3-4
Study record	s:		
Data management	11a	Describe the mechanism(s) that will be used to manage records and data throughout the review	4
Selection process	11b	State the process that will be used for selecting studies (such as two independent reviewers) through each phase of the review (that is, screening, eligibility and inclusion)	4
Data collection process	11c	Describe planned method of extracting data from reports (such as piloting forms, done independently, in duplicate), any processes for obtaining and confirming data from investigators	4-5
Data items	12	List and define all variables for which data will be sought (such as PICO items, funding sources), any preplanned data assumptions and simplifications (Note: Scoping reviews may not use PICO and instead may use JBI's Population, Concept, and Context [PCC] or another approach to reporting eligibility criteria)	4
Outcomes and prior- itization	13	List and define all outcomes for which data will be sought, including prioritization of main and additional outcomes, with rationale (Note: Scoping reviews may not extract outcome data, so this can refer to whichever data items are extracted)	5

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

1≸

1₹

Section and topic	Item No	Checklist item	Page
Risk of bias in indi- vidual studies	14	If this is to occur, describe anticipated methods for assessing risk of bias of individual studies, including whether this will be done at the outcome or study level, or both; state how this information will be used in data synthesis (Note: Scoping reviews typically do not include risk of bias assessment, but this information should be described if it will occur)	5
Data synthesis	15a	Describe criteria under which study data will be presented (Note: Scoping reviews do not typically include quantitative synthesis of study data, but should still describe in advance how extracted data are anticipated to be presented in the resulting review)	5
	15b	Describe the planned approach to how extracted data will be presented (such as figures, tables, evidence gaps maps)	5
	15c	Describe any proposed additional analyses (such as thematic analyses) (Note: The JBI methodological guidance does not recommend undertaking thematic analysis as this synthesis of data should ideally occur following methodological appraisal of the included sources)	n/a
	15d	If quantitative synthesis is not appropriate, describe the type of summary planned	4
Meta-bias(es)	16	Specify any planned assessment of meta-bias(es) (such as publication bias across studies, selective reporting within studies) (Note: Scoping reviews typically do not include assessment of meta-bias[es], but this information should be described if it will occur)	n/a
Confidence in cumu- lative evidence	17	Describe how the strength of the body of evidence will be assessed (such as GRADE)	n/a

GRADE, Grading of Recommendations, Assessment, Development and Evaluation; PICO, participants, intervention, comparator, outcomes; PRISMA, Preferred Reporting Items for Systematic Reviews and Meta-Analyses.
