ABSTRACT

Introduction: Heart failure with preserved ejection fraction (HFpEF) is common and causes functional limitation, poor health-related quality of life (HRQoL), and impairs prognosis. Exercise-based cardiac rehabilitation is a promising intervention for HFpEF but there is currently insufficient evidence to support its routine use. This trial will assess the clinical effectiveness and cost-effectiveness of a 12-week health professional facilitated, home-based rehabilitation intervention (REACH-HF), in people with HFpEF, for participants and their caregivers.

Methods and analysis: REACH-HFpEF is a parallel two group multicentre randomised controlled trial with 1:1 individual allocation to the REACH-HF intervention plus usual care (intervention group) or usual care alone (control group) with a target sample of size of 520 participants with HFpEF and their caregivers recruited from secondary care centres in England, Scotland, and Wales. Outcome assessment and statistical analysis will be performed blinded; outcomes will be assessed at baseline, 4- and 12-months follow up. The primary outcome measure will be patients' disease-specific HRQoL, measured using the Minnesota Living with Heart Failure questionnaire, at 12 months. Secondary outcomes include exercise capacity, psychological wellbeing, level of physical activity, generic HRQoL, selfmanagement, frailty, blood biomarkers, survival, hospitalisations and other adverse events, and perceived burden on caregivers. A process-evaluation and sub-study will assess the fidelity of intervention delivery and adherence to home-based exercise regime and explore potential mediators and moderators of changes in HRQoL with the intervention. Qualitative studies will describe facilitators' experiences of delivery of the intervention. A cost-effectiveness analysis (CEA) of the REACH-HF intervention in participants with HFpEF will estimate incremental cost per qualityadjusted life year (QALY) at 12 months. The CEA will be conducted from a UK NHS and Personal Social Services (PSS) perspective and a wider societal perspective. The adequacy of trial recruitment in an initial 6-month internal pilot period will also be checked.

Ethics and dissemination: The study is approved by the West of Scotland Research Ethics Committee (ref 21/WS/0085). Results will be disseminated via peer-reviewed journal publication and conference presentations to researchers, service users, and policymakers.

Trial registration number: ISRCTN47894539. Pre-results.

Funding: This work was supported by National Institute of Health Research, grant number: 130487

Keywords: Heart Failure, Preserved Ejection Fraction, Rehabilitation, Self-care, Diastolic dysfunction

Strengths and limitations of this study:

- A pragmatic randomised trial comparing an established rehabilitation programme (REACH-HF) with usual care for individuals with heart failure and preserved left ventricular ejection fraction, with blinded outcome assessment and data analysis.
- Embedded process evaluation to determine the fidelity of intervention delivery and participant and healthcare provider experience.
- Concurrent economic evaluation with both a UK National Health Service and Personal Social Services perspective and a societal perspective.
- A home-based model of intervention delivery that can improve access to rehabilitation services for people with heart disease.
- Incorporation of caregivers in both the delivery of rehabilitation and assessing its effects and potential to provide substantial impact on quality of life for patients with high levels of morbidity for whom there are few effective interventions.

INTRODUCTION

Heart failure (HF) is common and often leads to impaired physical function and reduced health-related quality of life (HRQoL), and increases morbidity, mortality and healthcare costs [1-5]. At least half of people with HF have preserved ejection fraction (HFpEF) [3,6]. In contrast to HF with reduced ejection (HFrEF), for which there are a several guideline-recommended pharmacological and non-pharmacological therapies that improve life expectancy and HRQoL, there are few for HFpEF, including sodium-glucose co-transporter 2 inhibitors [7]. A recent meta-analysis of seven randomised controlled trials (RCTs) involving 346 participants with HFpEF, shows that participation in exercise training may improve exercise capacity and HRQoL [8]. Given the finite nature of this evidence base, larger multicentre trials with longer term follow up are still needed to confirm these potential benefits of exercise-based rehabilitation for HFpEF.

The Rehabilitation EnAblement in CHronic Heart Failure (REACH-HF) intervention is a comprehensive exercise-based rehabilitation and self-management programme informed by evidence, theory, and service user perspectives designed for people with HF and their caregivers [9]. As a home-based intervention, REACH-HF offers an alternative to traditional centre-based programmes and can improve access and uptake of rehabilitation [10]. A multicentre RCT showed the REACH-HF programme was clinically and cost-effective for people with HFrEF [11,12].

Additionally, a single centre pilot RCT in 50 participants with HFpEF allocated to receive REACH-HF or usual care alone demonstrated favourable trends, including improvements in disease-specific HRQoL (between group difference in Minnesota Living with Heart [MLwHF] Questionnaire total score: -11.5, 95% CI: -22.8 to 0.3 at 6-months follow up) and cost-effectiveness [13]. The pilot study supported the

BMJ Open

feasibility and acceptability of the REACH-HF intervention for participants with HFpEF and the RCT design.

Accordingly, the REACH-HFpEF trial was designed to investigate the clinical and cost-effectiveness of a home, exercise-based rehabilitation programme for patients with HFpEF.

Aims and objectives

We aim to assess the clinical effectiveness and cost-effectiveness of REACH-HF plus usual care (intervention) versus usual care alone (control) in participants with HFpEF and their caregivers.

The primary objective is to compare the primary outcome of disease-specific HRQoL at 12 months follow-up between participants with HFpEF in intervention and control groups.

Secondary objectives:

• To check adequacy of trial recruitment in an initial 6-month internal pilot study.

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

- To compare the following secondary outcomes between participants with HFpEF in the intervention and control groups at 4- and 12-months follow up: exercise capacity, psychological wellbeing, level of physical activity, generic HRQoL, disease specific HRQoL, self-management activities, frailty, prognostic biomarker, clinical events (death and hospital admission), and adverse events.
- To estimate the cost-effectiveness of REACH-HF, compared to usual care alone, in participants with HFpEF as incremental cost per quality-adjusted life year (QALY) at 12-months post-randomisation.

Enseignement Superieur (ABES) Protected by copyright, including for uses related to text and data mining, AI training, and similar technologies

- To explore the moderators and mediators of change in the primary outcome of participants with HFpEF in the intervention group.
 - To qualitatively explore REACH-HF facilitators' experiences of delivery of the intervention.
- To compare psychological wellbeing, HRQoL, self-care activities and burden between caregivers in the intervention and control groups at 4- and 12months follow up.
- To assess the fidelity of delivery of the REACH-HF intervention (to inform further future refinement/implementation in the UK NHS if the intervention is effective).

METHODS AND ANALYSIS

This protocol is reported in accordance with the Standard Protocol Item Recommendations for Interventional Trials (SPIRIT) 2013 guidance [14].

Design

REACH-HFpEF is a multicentre parallel two group superiority RCT with nested process and health economic evaluations and an internal pilot phase. Given the complex nature of the REACH-HF intervention, it is not possible to blind participants or those involved in the provision of care beyond the point of randomisation. Researchers collecting outcome data and the statistician undertaking the data analysis will be blinded to treatment allocation to minimise potential bias. The RCT was registered on 15th December 2021 (ISRCTN47894539). An illustration of the study design is shown in Figure 1. N.K

Setting

The study plans to recruit a total of 20 sites across England, Northern Ireland, Scotland, and Wales. Patients are being recruited from both primary and secondary care pathways including HF registers and outpatient clinics. Follow-up procedures will usually be conducted on NHS premises. Conduct of the study will be led by a local principal investigator, supported by a research nurse or fellow and/or research assistant at each site, all of whom are trained in Good Clinical Practice (GCP) and in the requirements of the study protocol.

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

Study population

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

> The study population includes eligible patients and caregivers. Participating patients will be aged 18 years or older and have a confirmed diagnosis of symptomatic HF with left ventricular ejection fraction \geq 45% within the last 3 years prior to randomisation, confirmed by echocardiography or magnetic resonance imaging (MRI). Patients who have undertaken cardiac rehabilitation within the last 12 months and those who have any contraindications to exercise training will be excluded. Inclusion and exclusion criteria are detailed in Figure 2.

> Participants are free to withdraw from the study or intervention at any time without giving a reason, and this will be reiterated while signing the informed consent forms. If a participant agrees to give a reason for their withdrawal, it will be recorded. Research data collected to the point of withdrawal will be included in analyses. Participating caregivers will be aged 18 years or older and providing unpaid support elie to patients.

Randomisation

Participants will be randomly allocated in a 1:1 ratio to either intervention or control group. Randomisation will be stratified by investigator site and minimised on investigator site, sex, and left ventricular ejection fraction (45-55% vs. >55%). Randomisation will be achieved by using a secure web-based system. The research team will enter the participant identifier and the system will verify eligibility using data contained in the eCRF.

Intervention

REACH-HF is a home-based CR programme providing self-care support to the patient and their caregiver [9,11,12]. It was developed in cooperation with people

9 | Page

BMJ Open

living with HF and their caregivers, as well as service providers using an established rigorous intervention development framework [9] to incorporate existing evidence, clinical guidance on HF self-care, behaviour change theory, and key stakeholder perspectives. Table 1 provides an intervention description according to the Template for Intervention Description and Replication (TIDieR) checklist [15]. Details of the exercise component of the intervention are provided in e-Table 1.

Usual care

Intervention and control patients will receive usual medical management as per clinical practice guidelines [3, 5] for treatment of participants with HFpEF. This includes the screening for both cardiovascular and non-cardiovascular comorbidities such as hypertension, diabetes mellitus, ischaemic heart disease and atrial fibrillation, which should be treated with safe and effective interventions that exist to improve symptoms, wellbeing, and prognosis. Diuretics are recommended in those who are congested to alleviate symptoms. As part of usual care, all patients in the trial will be provided with the British Heart Foundation 'Living with heart failure' booklet [16]. At the 4- and 12-month follow-up we will record any co-therapies received as part of usual care.

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

Outcome measures

All primary and secondary outcomes will be collected at baseline (pre-randomisation) and 4- and 12-months post-randomisation. At the time of follow-up patients will be asked if they have had any adverse events. The PIs will be required to report serious adverse events within 24 hours of becoming aware of the event to the Pharmacovigilance Office. Any serious adverse events occurring during the trial will

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

be recorded and reported to the Ethics Committee and the Data Monitoring Committee.

Primary outcome

Patient disease specific HRQoL data will be collected at 12 months postrandomisation through the MLwHF Questionnaire. This validated questionnaire consists of 21 items to assess the impact of living with HF on the key physical, emotional, social, and mental dimensions of quality of life [17]. It provides scores for two dimensions, physical and emotional, and a total score.

Secondary outcomes

Patients:

- Exercise capacity (incremental shuttle walk test) [18]
- Physical activity levels (accelerometry over a 9-day period, measured using the GENEActiv Original accelerometer) [19]
- Psychological wellbeing measured using Hospital Anxiety and Depression
 Scale (HADS) questionnaire) [20]
- Generic health-related quality of life using EuroQol EQ-5D-5L questionnaire
 [21]
- Generic health-related quality of life Short-Form-12 (SF-12)) [22]
- > Kansas City Cardiomyopathy Questionnaire (KCCQ) [23]
- Frailty using the Clinical Frailty Scale [24]
- > Self-care of HF Index (SCHFI) questionnaire [25]
- > Self-efficacy for key behaviours questionnaire [11]
- Biomarker of cardiac wall stress NT-proBNP level

- Clinical events assessed by deaths and hospital admissions (with HFrelatedness determined by an independent adjudication panel).

Caregivers:

- Caregiver Burden for HF Questionnaire (CBQ-HF) [26]
- Caregiver Contribution to Self-care of HF Index questionnaire (CC-SCHFI)
 [27]
- > Family Caregiver Quality of Life Scale questionnaire (FAMQOL) [28]
- > Generic health-related quality of life using EQ-5D-5L [21]
- Psychological wellbeing using Hospital Anxiety and Depression Scale (HADS) questionnaire [24].

Sample size

The trial sample size was calculated in accordance with the DELTA2 guidance [29]. A total of 520 (260 per group) participants with HFpEF is required for 90% power at 5% significance to detect a mean difference on the MLwHF Questionnaire of 5 points [17], assuming a standard deviation of 20 points [13], a within patient correlation of 0.59 between baseline and 6-month follow-up, and an attrition rate of 15%. A 5-point difference in MLwHFQ score represents a minimum clinically important difference. Data from REACH-HFpEF pilot trial [13] indicate that the correlation between baseline and 6 months will be at least 0.59 (estimated correlation 0.73, 95% confidence interval: 0.59 to 0.83).

Trial data collection

All required study data will be captured in a set of purpose built eCRFs. Access to the eCRFs will be restricted, via a trial-specific web portal, and only authorised

BMJ Open

> personnel will be able to enter data. The site Principal Investigator or their designee(s) will be responsible for all entries into the eCRF and will confirm that the data are accurate, complete, and verifiable. Data will be stored in a Microsoft SQL Server database at the University of Glasgow Clinical Trials Unit which has an ISO 9001 guality management system and ISO 27001 for Information Security. Participants will be able to complete their questionnaires on a paper CRF (that will then be entered into the eCRF by local research team) or to complete them electronically. Where completed electronically, data will be entered directly into a participant-facing version of the eCRF. As the eCRF will be adapted for selfcompletion, consent will be sought to use the participant contact details provided for re-contact to verify responses as needed. Participants who consent to long-term follow-up of their outcomes using routine data, NHS/Community Health Index (CHI) numbers will be collected to facilitate the potential collection of data in the future. Regular data management/cleaning will be undertaken to assess data quality. Quality assurance checks will be performed to monitor the level of missing data and the timeliness of data entry and check for inconsistent data.

Process evaluation

The process evaluation will assess the following research questions:

1. Was the intervention delivered as intended?

2. What adaptations were made/required in the intervention and do these impact outcomes?

3. Was the intervention used as intended?

4. What mechanisms explain any observed impact on patient's HRQoL and other patient and caregiver outcomes?

BMJ Open

5. What are the perspectives of patients, caregivers, and service providers on the experience of being involved in REACH-HF?

6. What factors are associated with variation in intervention effectiveness among intervention recipients?

7. What adaptations were made within the service and did these impact fidelity and outcomes?

The process evaluation will use mixed methods at multiple case levels (patient, facilitator, centre) to test the programme theory in the population with HFpEF, identifying which components and configurations are best suited to meet their needs [30, 31]. The process evaluation will identify refinements of the programme theory, to optimise implementation and ensure that the essential ingredients of future interventions are better identified, interrogated, and tested [32]. As the analysis progresses, the implementation strategy will be revisited focusing on potential outcomes such as Non-adoption, Abandonment, Scale-up, Spread, Sustainability (NASSS) Framework [33]. This will maximise the clinical application of our research findings and enhance the capacity of staff working with participants with HFpEF to implement the intervention.

The participants in this process evaluation will comprise a subsample of patients, caregivers and REACH-HF facilitators taking part in the REACH-HFpEF trial. To answer the research questions, this mixed-method process evaluation will utilise trial primary and secondary outcomes and collect additional qualitative data (e.g., intervention session recordings and interviews). The process evaluation will utilise multi-modal longitudinal data [34, 35].

Process evaluation 1: Participants and caregivers experience

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

15-20 patients (and 10 caregivers of these same patients) will be purposively selected and invited to take part in semi-structured interviews. Patients will be chosen to represent, for example, diversity in terms of site/facilitator, sex, ethnicity, presence of a caregiver and baseline MLwHF Questionnaire total score. The research team will interview each of these patients/caregivers at 4-months after the baseline visit (i.e., immediately after intervention delivery is complete) and 12-months after the baseline visit. This will allow capture of patient and caregiver narratives over time, in relation to both intervention receipt and the longer-term impact/maintenance of self-care following the intervention. We will audio or video record these interviews, which may be conducted in person (if possible) or remotely (if not). Recording will use encrypted recording methods (either via password-protected online meeting software or an encrypted voice-recorder). Written consent will be obtained prior to face-to-face interviews.

Topic guides for the interviews have been co-developed with the patient and public involvement (PPI) advisory group. Interviews are designed to last between 30 to 60 minutes. The researcher will endeavour to interview the patients without the caregiver present, where possible, and be mindful of the patient's symptoms, such as fatigue or breathlessness, which may make an interview burdensome for the participant. The two interviews (and potentially selected segments of the intervention session recordings which represent good practice), will be transcribed verbatim. Thus, for each patient, their qualitative dataset is likely to comprise: two face-to-face meetings with their facilitator, 5 telephone meetings with their facilitator and two interviews with the process evaluation team.

Process evaluation 2: REACH-HF facilitator's experience

BMJ Open

In addition, 15 REACH-HF facilitators will be invited to take part in the process evaluation.

The process evaluation team will send an email to the participating facilitators with a brief questionnaire about their clinical background. This short questionnaire will either be completed in an electronic Word document and returned via email, or by following a link in the email to an electronic questionnaire (e.g., using the electronic questionnaire platform Qualtrics). The process evaluation team will endeavour to sample REACH-HF facilitators to represent diversity in, for example, site, background training (e.g., physiotherapy, nursing) and years of experience in delivery of cardiac rehabilitation (gathered using the clinical background questionnaire, see above). A topic guide will inform the interview, premised on the existing literature and gaps in current knowledge about intervention delivery. These interviews will be conducted either in person or remotely via by telephone/web-call. Verbatim interview transcripts will be organised and coded using MAXQDA. A framework analysis will be conducted, and sections of data relating to the aims of this research will be assigned a code that summarizes the content either descriptively or interpretively. Codes with common features will be grouped together in themes, before finally being assigned to overarching themes. Where possible, data about self-reported behaviour from the interviews will be compared with observed behaviour evident in the intervention session recordings. A second gualitative researcher from the team will conduct independent analysis of a subset of the data. The researchers' reflexive memo notes will enhance the integrity of the analysis.

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

The analysis will characterise patients' and caregivers observed and self-reported responses to the intervention and link these responses to engagement with

intervention and perceived benefit, identifying interpersonal processes that shape effectiveness or ineffectiveness of the intervention. At 4-months, patients', and caregivers' engagement with, response to and use of the REACH HF Manual will be characterised and differences between patients noted. At 12-months, overall use and benefit and maintenance of self-care behaviours and coping skills will be characterised and linked to individual differences in 4-month responses. Analysis will explore both patients' and caregivers' experiences of participation in the intervention and explicitly examine any potential impact of caregiver presence on patient adherence to the REACH-HF intervention.

Process evaluation 3: Fidelity of intervention delivery

Facilitator-patient interactions (face-to-face and phone) for up to 60 patients will be audio-recorded (approximately 5-6 interactions taking 4-5 hours per patient). Recordings will be assessed using a previously developed and tested fidelity assessment checklist [8]. The 12-item checklist uses a 0-5 rating scale based on the Drevfus scale for assessing clinical competence [36]. It focuses on assessing the quality of delivery of key delivery processes, such as the use of a patient-centred communication style, making a plan of action and encouraging self-monitoring of progress (particularly with the exercise programme). Intervention delivery fidelity data will be presented descriptively (mean scores with standard deviations or 95%) Cls) and broken down by site and by facilitator (as well as the calculation of overall delivery fidelity scores) for each checklist item. This will clarify how well intervention components were delivered and may identify ways to optimise delivery for future implementation. It will also allow researchers to describe variability in fidelity of delivery across patients and facilitators.

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

BMJ Open

In addition, segments of the recordings that represent clear examples of good practice associated with each component of delivery (each item on the checklist) will be identified by noting the start /end timestamps of the segment within the audio file. These segments will be transcribed and collated for informing future REACH-HF training. Any information that might be used to identify the patient or the facilitator within the transcript will be redacted.

We will report descriptive statistics to summarise the fidelity of intervention delivery for each checklist item and will (descriptively and anonymously) examine variations between sites. Synthesis of the analysis of the intervention delivery fidelity and the interview data will enable a qualitative evaluation of potential pathways and barriers to improvement, which will pay attention to discrepancies between expected and observed outcomes, to understand how context influences outcomes, and to provide insights to aid future implementation.

Process evaluation 4: Facilitator checklist and log

REACH-HF facilitators will be asked to complete a brief self-rated fidelity checklist after each session they deliver. This comprises questions about the same 12 delivery fidelity components described above and allows the facilitators to rate the occurrences of each feature (absence, minimal, some, sufficient, good, very good, excellent). An independent observer-rating is resource-intensive, while self-rated assessment may provide a pragmatic, real-world alternative to monitor delivery quality. The validity of the self-rating method will be checked by examining the correlation with observer-rated intervention delivery fidelity. We will also explore in the qualitative interviews whether use of the checklist facilitates /encourages reflexive practice and, in doing so, quality of implementation. **BMJ** Open

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

Additionally, facilitators will be asked to complete a facilitator contact log for each participant. This log is a one-page pro forma designed to capture time, expenditure and any other resources required for the implementation of REACH-HF, as well as any adaptations made to the intervention for individual patients. It will capture data for both assessment of the fidelity of REACH-HF delivery and economic analyses. A detailed process evaluation analysis plan will be drafted prior to study data lock and agreed with the Trial Management Group and Trial Steering Committee.

Economic evaluation

Economic analysis will be performed to establish the cost-effectiveness of REACH-HF plus usual care compared to usual care alone. Following on from the results of the economic evaluation pilot study [13] a within-trial cost-utility analysis will be conducted. Pilot study findings revealed differential resource distributions across primary, secondary and social care as well as impacts on informal carer time and costs. Bespoke data capture instruments have been developed to ensure capture of all relevant resource use from both an NHS/Personal Social Services (PSS) perspective, as well as a broader societal perspective. There is evidence of insensitivity of the EQ-5D-5L in patients with mild HF [35, 37-40]. A recent study comparing the EQ-5D-5L and short-form six-dimension (SF-6D) in elderly participants with HF recommends use of SF-6D in those with milder disease and economic outcomes [41]. Therefore, we propose to use both the SF-6D (from SF-12) and the EQ-5D-5L. As recommended by NICE economic evaluation guidance, the base-case perspectives will be that of the UK NHS and PSS [42]. Further, a broader societal perspective, accounting for resource use, productivity (employment) and personal cost impacts faced by patients and their carers will be considered in

BMJ Open

sensitivity analyses, along with a scenario analysis incorporating HRQoL values obtained from mapping MLwHF Questionnaire scores to EQ-5D utilities, using a validated mapping algorithm [43, 44]. The base case economic evaluation will estimate the incremental cost per QALY associated with the REACH-HF intervention, compared to usual care alone, and will be reported in line with updated reporting guidelines for economic evaluations [45]. The wider societal perspective will incorporate resource use, productivity (employment) and personal costs. Missing resource use and outcome data will be handled using multiple imputation [46]. If within-trial results reveal between-group differences in HRQoL, a decision analytic model will be developed to estimate the cost-effectiveness results over a lifetime horizon.

A detailed health economic analysis plan (HEAP) will be drafted prior to study data lock and agreed with the Trial Management Group and Trial Steering Committee. Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

Statistical analysis

Participation from screening to completion of the final follow-up assessment will be reported. Baseline patient characteristics and outcome scores will be summarised descriptively.

The primary statistical analysis for both primary and secondary outcomes will take an intention to treat approach (according to randomised allocation) based on complete data. For continuous outcome measures, mixed-effects regression will be used with a random effect of recruiting site and adjusting for baseline outcome score and minimisation variables. Additional clustering of outcomes due to therapist effects will be accounted for in sensitivity analyses.

BMJ Open

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

A number of secondary analyses will be undertaken. Patterns and reasons of missing outcome data will be assessed, and sensitivity analyses will use appropriate imputation models to assess the impact of missing data. Potential subgroup treatment effects will be explored by adding treatment-by-subgroup interaction terms to analysis models. Potential subgroups assessed will include sex, study site and participant baseline NT-proBNP levels, ejection fraction, and important markers of inequity, such as age, socio-economic status, and having a carer. Since the trial is powered to detect overall differences between the groups rather than interactions of this kind, these subgroup analyses will be regarded as exploratory. Before the start of recruitment, the TMG (with TSC approval) will be asked to define the minimum adherence to the REACH-HF intervention required to indicate compliance. Complier average causal effects analyses will be used to estimate the causal intervention effect in relation to each outcome.

Adherence will be defined using criteria adapted for the delivery processes proposed for the current study. These criteria will be developed with the Trial Management Group, building on the criteria used in the prior multicentre REACH-HF trial in people with HFrEF [11]. Associations between physiological, cognitive and demographic factors and intervention adherence will be explored.

Estimated between-group differences will be presented using both absolute and relative measures, with associated 95% confidence intervals, where appropriate. No correction of P-values for multiplicity of testing will be undertaken. However, the analysis for the primary outcome will be performed before all other analyses and the P-values of all subsequent analyses interpreted in the context of multiple testing. No interim analyses are planned. Safety/adverse event outcomes will be reported descriptively by group.

21 | Page

 BMJ Open

A detailed statistical analysis plan will be drafted prior to study data lock and agreed with the Trial Management Group and Trial Steering Committee.

Sub-studies

Three pre-specified sub-studies are being undertaken alongside the main REACH-HF trial.

- Study Within a Trial (SWAT): The objective of the SWAT is to determine if an evidence-based enhanced participant information sheet impacts on recruitment and retention of caregivers to a multi-centre host trial. Embedded in the main trial, the SWAT will be a cluster RCT design with allocation of the trial sites to either the enhanced host trial caregiver PIS (SWAT intervention group) or the standard host trial caregiver PIS (SWAT control group). The SWAT is led by University College Dublin, is registered with the ISRCTN trial registry (ISRCTN15757498) and with the MRC SWAT Repository (https://www.qub.ac.uk/sites/TheNorthernIrelandNetworkforTrialsMethodology Research/FileStore/Filetoupload,1218962,en.pdf). The SWAT protocol will be submitted for publication separately.
- Optimisation of Exercise Fidelity in Home-Based Cardiac Rehabilitation Study. This sub-study aims to apply novel indicators of exercise fidelity (i.e. quality of exercise in relation to the exercise prescribed) in the participants with HFpEF participating in the main trial. By identifying measurable indicators of exercise fidelity and associate them with patient outcomes, the sub-study intends to identify ways to assess and tailor future home-based exercise interventions. Assessing the quality of the patients' exercises might also give them useful feedback about their progress and how they can get more benefit from the

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, AI training, and similar technologies

exercise component in future implementations of the REACH-HFpEF (or other home-based exercise interventions). This sub-study is led by University of Birmingham.

This sub-study will seek sample of up to 80 intervention group patient participants with a tracker watch and mobile phone and a brief questionnaire, These will be used to a) measure resting heart rate pre and post intervention b) monitor heart rate during all their REACH-HFpEF exercise sessions and c) video-record 1-2 exercise sessions to check for safety and accuracy-of-Quantitative

Mediation Analysis: The proposed statistical mediation sub-study will form an extension of the main trial process evaluation and aims to assess the association of the change of secondary outcomes as potential mediators of the REACH-HFpEF intervention primary outcome measure (MLwHF questionnaire). This substudy is led by University of Exeter.

Data monitoring and quality assurance

Trial-specific work instructions will be developed in accordance with University of Glasgow Clinical Trial Unit procedures. Regular data management and cleaning will be undertaken to assess data quality. Quality assurance checks will be undertaken to monitor the level of missing data and the timeliness of data entry and check for illogical or inconsistent data. The research team will monitor data collection procedures, ensuring that study data entry procedures are followed.

Trial management and independent committees

BMJ Open

The Trial Operations Group (TOG) team members directly involved with the day-today running of the trial (co-chief investigators [CC/RST] and trial managers [EB/COH/AP/ET] and trial administrator) will meet on a two weekly basis to monitor discuss the day-to-day management and all aspects of progress of the study. The TOG will have regular contact with trial sites by email and webinar meetings. The Trial Management Group (TMG) including the health economics, statistics, process evaluation teams, co-applicants, and PPI representation will meet on a termly basis to review status of the study and trial progress.

The REACH-HFpEF Trial Steering Committee (TSC) consists of independent members with clinical and trial methodological expertise and includes a patient and public involvement representative. The TSC will provide independent oversight of the conduct, timelines and funding of the trial with safety and ethics review by an independent Data Monitoring Committee (DMC). The TSC and DMC will normally meet one to two times per year. Detailed descriptions of the remit and function of the committees are documented in specific charters held in the Trial Master File by Glasgow Clinical Trials Unit. Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

Patient and public involvement

A PPI group will be established for this trial: 12 participants with lived experience of HFpEF and their partners/carers. These patients are usually managed and monitored in general practice [12]. We will advertise on the NIHR People in Research website to recruit these patients and their partners/carers to the PPI group. An induction webinar will be held to introduce the group to the study and to negotiate characteristics of the PPI role throughout the study, including training and support needs. Additionally, PPI representatives were members of the Trial Management Group and Trial Steering Committee.

Ethics and dissemination

The study will be conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and that are consistent with ICH GCP, and in accordance with the Research Governance Framework for Health and Social Care, Second edition (2005). The study and all relevant study documents have been reviewed and approved by the West of Scotland Research Ethics Service (reference number 21/WS/0085). The study sponsor is The NHS Greater Glasgow and Clyde. Written informed consent will be obtained from all study participants prior to enrolment to the trial.

Study results will be published in open access publications in high impact peerreviewed journals, including an end of trial NIHR monograph, and will be presented at national and international conferences. The study will be featured at stakeholder dissemination workshop (with patients, clinicians, commissioners, academics, and key groups such as British Heart Foundation, British Association for Cardiovascular Prevention and Rehabilitation (BACPR) and Pumping Marvellous). Direct feedback will be given to trial participants and information will be digitally publicised on REACH-HF website and relevant profiles on social media platforms.

Trial status

The first participant with HFpEF was recruited in May 2022. At the time of submission, the trial has opened at 20 sites in England, Scotland, and Wales (see

1	
2	
3	appendix for listing) and has recruited 308 participants with HFpEF and 82
4	
5	caregivers.

	1		
1. Brief	Rehabilitation EnAblement in CHronic Heart Failure (REACH-HF)		
name			
2. Why	The rationale for REACH-HF was to provide a home-based		
	rehabilitation comprehensive self-care support programme to people		
	with heart failure and their caregivers to help them manage their		
	condition (https://sites.exeter.ac.uk/reachhf/).		
	It was co-created with people living with heart failure and their		
	families, as well as service providers using an established rigorous		
	intervention development framework to incorporate existing evidence,		
	clinical guidance on HF self-care, behaviour change theory and key		
	stakeholder perspectives (patients, caregivers, service providers and		
	experts in the field) [14].		
	REACH-HF draws on several theoretical perspectives, but key		
	principles included building understanding of the condition to provide		
	a rationale for change (Leventhal's Common-Sense Model [47]) such		
	as how physical fitness affects heart failure symptoms); building		
	intrinsic motivation and promoting autonomy (Self-Determination		
	Theory [48]); promoting adaptation to living with heart failure and		
	adopting an active rather than passive approach to coping [49,50];		
	and encouraging learning from experience through engagement in		
	self-regulation activities (Control Theory [51]). The elements aimed at		
	managing stress and anxiety used psychological intervention		
	processes based on cognitive behaviour therapy [52] and		
	mindfulness therapy [53,54].		
3. What -	The REACH-HF intervention includes four core elements:		
materials	REACH-HF Manual for patients with a choice of two structured		
	exercise programs: a chair-based exercise and a progressive		
	walking training programme (available as a CD and from		
	REACH-HF website) and relaxation programme (available as		
	a CD and REACH-HF website. Patients are advised to		
	exercise ≥3 times per week, starting from their own personal

	level and gradually building up over 2-3 months in		
	time/distance/walking pace.		
	 Patient 'Progress Tracker' – an interactive booklet designed to 		
	facilitate learning from experience to record symptoms,		
	physical activity, and other actions related to self-care.		
	Patient's record: (1) how long/far they plan to walk, (2)		
	whether they have done it, (3) how it felt to identify whether		
	they should be moving up or down in efforts next time and (4)		
	their weekly steps per minute (pace).		
	 'Family and Friends Resource' – a manual for use by 		
	caregivers aimed to increase their understanding of HF and		
	caregiver physical and mental wellbeing.		
	 Facilitation by healthcare staff (e.g., nurse, physiotherapist, 		
	exercise specialist) experienced in cardiac rehabilitation/heart		
	failure management.		
	The REACH-HF programme was originally designed for patients with		
	HFrEF. However, sections of the manual (including the medication		
	section) have been revised to make it relevant to patients with		
	HFpEFs, and an additional section on the nature of causes and		
	treatment of HFpEF has been added.		
4. What –	Patients and caregivers work through the self-help manual over a 12-		
procedures	week period with facilitation involving contact by a specially trained		
	intervention facilitator who will help to assess patient needs and		
	concerns, build the patient's and caregiver's understanding of how		
	best to manage HFpEF and provide individually tailored support		
	based on each patient's identified needs and concerns.		
5. Who	REACH-HFpEF trial funding is provided for two/three healthcare		
provided	professionals with experience of cardiac rehabilitation/heart failure:		
	cardiac rehabilitation nurse, physiotherapist or exercise specialist, or		
	HF specialist nurse) from each site, who are responsible for		
	delivering the REACH-HF intervention, and will attend a two-day		
	web-based training course on the use of person-centred counselling		
	and how to tailor the intervention for the patient and their caregiver,

υU	

	led by clinicians in the Heart Manual Department, NHS Lothian
	(https://services.nhslothian.scot/theheartmanual/reachhf/).
	Topics covered in training include: self-management in HF;
	psychological aspects of HF; health behaviour change; supporting
	family and caregivers; physical activity and chair-based exercise.
6. How	The programme has been designed to be delivered over 12 weeks,
	with a recommended two face-to-face contacts with a REACH-HF
	facilitator taking place in the patient home, and 2-3 follow-up
	telephone contacts in between.
	'Real world' programme implementation, especially during the
	COVID-19 pandemic, has resulted in alternative modes of delivery.
	These have included: combined centre- and home-based delivery
	(e.g. baseline and end-of-treatment assessments conducted in
	clinics, with home visits and/or phone support in between) and an
	entirely remote delivery model, where all sessions (including
	assessments) were conducted by telephone.
7. Where	Patient home and/or clinic.
8. When	Initial face-to-face session: 60-90mins – initial clinical consultation,
and How	facilitator discusses programme & introduces patient/caregiver to the
Much	REACH-HF resources.
	Telephone consultations: 2-3 (dependent on patient needs) of
	~10mins – check on progress with HF manual and exercise
	programme.
	Final face-to-face session: 60-90mins - final clinical consultation,
	review of goals and plan for continuing REACH-HF programme
	independently
9. Tailoring	Whilst the principles of the REACH-HF intervention are the same
	across HF patients, facilitators are trained to tailor intervention
	delivery to individual patient needed e.g. adjust exercise level to
	current fitness.

1 ABSTRACT

Introduction: Heart failure with preserved ejection fraction (HFpEF) is common and
causes functional limitation, poor health-related quality of life (HRQoL), and impairs
prognosis. Exercise-based cardiac rehabilitation is a promising intervention for
HFpEF but there is currently insufficient evidence to support its routine use. This trial
will assess the clinical effectiveness and cost-effectiveness of a 12-week health
professional facilitated, home-based rehabilitation intervention (REACH-HF), in
people with HFpEF, for participants and their caregivers.

Methods and analysis: REACH-HFpEF is a parallel two group multicentre randomised controlled trial with 1:1 individual allocation to the REACH-HF intervention plus usual care (intervention group) or usual care alone (control group) with a target sample of size of 520 participants with HFpEF and their caregivers recruited from secondary care centres in England, Scotland, and Wales. Outcome assessment and statistical analysis will be performed blinded; outcomes will be assessed at baseline, 4- and 12-months follow up. The primary outcome measure will be patients' disease-specific HRQoL, measured using the Minnesota Living with Heart Failure questionnaire, at 12 months. Secondary outcomes include exercise capacity, psychological wellbeing, level of physical activity, generic HRQoL, self-management, frailty, blood biomarkers, survival, hospitalisations and other adverse events, and perceived burden on caregivers. A process-evaluation and sub-study will assess the fidelity of intervention delivery and adherence to home-based exercise regime and explore potential mediators and moderators of changes in HRQoL with the intervention. Qualitative studies will describe facilitators' experiences of delivery of the intervention. A cost-effectiveness analysis (CEA) of the REACH-HF intervention in participants with HFpEF will estimate incremental cost per quality-adjusted life year (QALY) at 12 months. The CEA will be conducted from a UK NHS and Personal Social Services (PSS) perspective and a wider societal perspective. The adequacy of trial recruitment in an initial 6-month internal pilot period will also be checked.

Ethics and dissemination: The study is approved by the West of Scotland
 Research Ethics Committee (ref 21/WS/0085). Results will be disseminated via peer reviewed journal publication and conference presentations to researchers, service
 users, and policymakers.

1 INTRODUCTION

Heart failure (HF) is common and often leads to impaired physical function and
reduced health-related quality of life (HRQoL), and increases morbidity, mortality and
healthcare costs [1-5]. At least half of people with HF have preserved ejection
fraction (HFpEF) [3,6]. In contrast to HF with reduced ejection (HFrEF), for which

6 there are a several guideline-recommended pharmacological and non-

pharmacological therapies that improve life expectancy and HRQoL, there are few
for HFpEF, including sodium-glucose co-transporter 2 inhibitors [7]. A recent metaanalysis of seven randomised controlled trials (RCTs) involving 346 participants with
HFpEF, shows that participation in exercise training may improve exercise capacity
and HRQoL [8]. Given the finite nature of this evidence base, larger multicentre trials
with longer term follow up are still needed to confirm these potential benefits of
exercise-based rehabilitation for HFpEF.

The Rehabilitation EnAblement in CHronic Heart Failure (REACH-HF) intervention is a comprehensive exercise-based rehabilitation and self-management programme informed by evidence, theory, and service user perspectives designed for people with HF and their caregivers [9]. As a home-based intervention, REACH-HF offers an alternative to traditional centre-based programmes and can improve access and uptake of rehabilitation [10]. A multicentre RCT showed the REACH-HF programme was clinically and cost-effective for people with HFrEF [11,12].

Additionally, a single centre pilot RCT in 50 participants with HFpEF allocated to
receive REACH-HF or usual care alone demonstrated favourable trends, including
improvements in disease-specific HRQoL (between group difference in Minnesota
Living with Heart [MLwHF] Questionnaire total score: -11.5, 95% CI: -22.8 to 0.3 at
6-months follow up) and cost-effectiveness [13]. The pilot study supported the

BMJ Open

2		
3 4	1	feasibility and acceptability of the REACH-HF intervention for participants with
5 6	2	HFpEF and the RCT design.
7 8 9	3	Accordingly, the REACH-HFpEF trial was designed to investigate the clinical and
10 11	4	cost-effectiveness of a home, exercise-based rehabilitation programme for patients
12 13	5	with HFpEF.
14 15 16	6	
10 17 18	7	Aims and objectives
19 20	8	We aim to assess the clinical effectiveness and cost-effectiveness of REACH-HF
21 22 22	9	plus usual care (intervention) versus usual care alone (control) in participants with
23 24 25	10	HFpEF and their caregivers.
26 27	11	The primary objective is to compare the primary outcome of disease-specific HRQoL
28 29	12	at 12 months follow-up between participants with HFpEF in intervention and control
30 31 32	13	groups.
33 34	14	Secondary objectives:
35 36	15	• To check adequacy of trial recruitment in an initial 6-month internal pilot study.
37 38 39	16	 To compare the following secondary outcomes between participants with
40 41	17	HFpEF in the intervention and control groups at 4- and 12-months follow up:
42 43	18	exercise capacity, psychological wellbeing, level of physical activity, generic
44 45 46	19	HRQoL, disease specific HRQoL, self-management activities, frailty,
40 47 48	20	prognostic biomarker, clinical events (death and hospital admission), and
49 50	21	adverse events.
51 52 53	22	To estimate the cost-effectiveness of REACH-HF, compared to usual care
55 54 55	23	alone, in participants with HFpEF as incremental cost per quality-adjusted life
56 57	24	year (QALY) at 12-months post-randomisation.

•

METHODS AND ANALYSIS

This protocol is reported in accordance with the Standard Protocol Item

Recommendations for Interventional Trials (SPIRIT) 2013 guidance [14].

Design

REACH-HFpEF is a multicentre parallel two group superiority RCT with nested process and health economic evaluations and an internal pilot phase. Given the complex nature of the REACH-HF intervention, it is not possible to blind participants or those involved in the provision of care beyond the point of randomisation. Researchers collecting outcome data and the statistician undertaking the data analysis will be blinded to treatment allocation to minimise potential bias. The RCT was registered on 15th December 2021 (ISRCTN47894539). An illustration of the study design is shown in Figure 1. S.J.K

Setting and recruitment

The study plans to recruit a total of 20 sites across England, Northern Ireland, Scotland, and Wales. Patients are being recruited from both primary and secondary care pathways including HF registers and outpatient clinics. Follow-up procedures will usually be conducted on NHS premises. Conduct of the study will be led by a local principal investigator, supported by a research nurse or fellow and/or research assistant at each site, all of whom are trained in Good Clinical Practice (GCP) and in the requirements of the study protocol.

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

We have experienced a slower rate of trial recruitment of 0.8 patient /site/month

compared to our predicted of 1.5 patients/site/month. As a result, we have

implemented a number of strategies: (1) negotiated with our trial funder (NIHR) a 9-

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

month extension to our recruitment closure date; (2) regular communication with our
sites including quarterly trials newsletter, a weekly email to all sites of recruitment
figures, and termly principle investigator/trial site team web meetings to discuss
progress; and (3) introduction of a financial incentive to sites based on successful
patient recruitment.

7 Study population

The study population includes eligible patients and caregivers. Participating patients will be aged 18 years or older and have a confirmed diagnosis of symptomatic HF with left ventricular ejection fraction \geq 45% within the last 3 years prior to randomisation, confirmed by echocardiography or magnetic resonance imaging (MRI). Patients who have undertaken cardiac rehabilitation within the last 12 months and those who have any contraindications to exercise training will be excluded. Inclusion and exclusion criteria are detailed in Figure 2. Participants may choose to withdraw at any time and are given the option to fully withdraw from the study or they can withdraw from the intervention and/or site visits but continue to complete the patient reported outcome questionnaires only, especially the primary outcome of MLWHF questionnaire. Data will be collected up to the point of withdrawal and used for analysis. If a participant deviates from the intervention protocol they will be followed-up as intention to treat. Participating caregivers will be aged 18 years or older and providing unpaid support to patients. Participant and carer consent forms are available to view as supplemental file 1 & supplemental file 2.

25 Randomisation

Page 11 of 46

BMJ Open

Participants will be randomly allocated in a 1:1 ratio to either intervention or control
group. Randomisation will be stratified by investigator site and minimised on
investigator site, sex, and left ventricular ejection fraction (45-55% vs. >55%).
Randomisation will be achieved by using a secure web-based system. The research
team will enter the participant identifier and the system will verify eligibility using data
contained in the eCRF.

9 REACH-HF is a home-based CR programme providing self-care support to the
10 patient and their caregiver [9,11,12]. It was developed in cooperation with people
11 living with HF and their caregivers, as well as service providers using an established
12 rigorous intervention development framework [9] to incorporate existing evidence,
13 clinical guidance on HF self-care, behaviour change theory, and key stakeholder
14 perspectives. Table 1 provides an intervention description according to the Template
15 for Intervention Description and Replication (TIDieR) checklist [15].

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

Table 1. Summary of the REACH-HF intervention description according to the Template for Intervention Description and Replication (TIDieR) [15]

1. Brief	Rehabilitation EnAblement in CHronic Heart Failure (REACH-HF)
name	
2. Why	The rationale for REACH-HF was to provide a home-based
	rehabilitation comprehensive self-care support programme to people
	with heart failure and their caregivers to help them manage their
	condition (https://sites.exeter.ac.uk/reachhf/).
	It was co-created with people living with heart failure and their
	families, as well as service providers using an established rigorous
	intervention development framework to incorporate existing evidence,
	clinical guidance on HF self-care, behaviour change theory and key

	stakeholder perspectives (patients, caregivers, service providers and
	experts in the field) [14].
	REACH-HF draws on several theoretical perspectives, but key
	principles included building understanding of the condition to provide
	a rationale for change (Leventhal's Common-Sense Model [48]) such
	as how physical fitness affects heart failure symptoms); building
	intrinsic motivation and promoting autonomy (Self-Determination
	Theory [49]); promoting adaptation to living with heart failure and
	adopting an active rather than passive approach to coping [50,51];
	and encouraging learning from experience through engagement in
	self-regulation activities (Control Theory [52]). The elements aimed at
	managing stress and anxiety used psychological intervention
	processes based on cognitive behaviour therapy [53] and
	mindfulness therapy [54,55].
3. What -	The REACH-HF intervention includes four core elements:
materials	REACH-HF Manual for patients with a choice of two structured
	exercise programs: a chair-based exercise and a progressive
	walking training programme (available as a CD and from
	REACH-HF website) and relaxation programme (available as
	a CD and REACH-HF website. Patients are advised to
	exercise ≥3 times per week, starting from their own personal
	level and gradually building up over 2-3 months in
	time/distance/walking pace.
	Patient 'Progress Tracker' – an interactive booklet designed to
	facilitate learning from experience to record symptoms,
	physical activity, and other actions related to self-care.
	Patient's record: (1) how long/far they plan to walk, (2)
	whether they have done it, (3) how it felt to identify whether
	they should be moving up or down in efforts next time and (4)
	their weekly steps per minute (pace).
	 'Family and Friends Resource' – a manual for use by
	caregivers aimed to increase their understanding of HF and
	caregiver physical and mental wellbeing.

	Facilitation by healthcare staff (e.g., nurse, physiotherapist,
	exercise specialist) experienced in cardiac rehabilitation/heart
	failure management.
	The REACH-HF programme was originally designed for patients with
	HFrEF. However, sections of the manual (including the medication
	section) have been revised to make it relevant to patients with
	HFpEFs, and an additional section on the nature of causes and
	treatment of HFpEF has been added.
4. What –	Patients and caregivers work through the self-help manual over a 12-
procedures	week period with facilitation involving contact by a specially trained
	intervention facilitator who will help to assess patient needs and
	concerns, build the patient's and caregiver's understanding of how
	best to manage HFpEF and provide individually tailored support
	based on each patient's identified needs and concerns.
5. Who	REACH-HFpEF trial funding is provided for two/three healthcare
provided	professionals with experience of cardiac rehabilitation/heart failure:
	cardiac rehabilitation nurse, physiotherapist or exercise specialist, or
	HF specialist nurse) from each site, who are responsible for
	delivering the REACH-HF intervention, and will attend a two-day
	web-based training course on the use of person-centred counselling
	and how to tailor the intervention for the patient and their caregiver,
	led by clinicians in the Heart Manual Department, NHS Lothian
	(https://services.nhslothian.scot/theheartmanual/reachhf/).
	Topics covered in training include: self-management in HF;
	psychological aspects of HF; health behaviour change; supporting
	family and caregivers; physical activity and chair-based exercise.
6. How	The programme has been designed to be delivered over 12 weeks,
	with a recommended two face-to-face contacts with a REACH-HF
	facilitator taking place in the patient home, and 2-3 follow-up
	telephone contacts in between.
	'Real world' programme implementation, especially during the
	COVID-19 pandemic, has resulted in alternative modes of delivery.
	These have included: combined centre- and home-based delivery

	(e.g. baseline and end-of-treatment assessments conducted in
	clinics, with home visits and/or phone support in between) and an
	entirely remote delivery model, where all sessions (including
	assessments) were conducted by telephone.
7. Where	Patient home and/or clinic.
8. When	Initial face-to-face session: 60-90mins – initial clinical consultation,
and How	facilitator discusses programme & introduces patient/caregiver to the
Much	REACH-HF resources.
	Telephone consultations: 2-3 (dependent on patient needs) of
	~10mins – check on progress with HF manual and exercise
	programme.
	Final face-to-face session: 60-90mins - final clinical consultation,
	review of goals and plan for continuing REACH-HF programme
	independently
9. Tailoring	Whilst the principles of the REACH-HF intervention are the same
	across HF patients, facilitators are trained to tailor intervention
	delivery to individual patient needed e.g. adjust exercise level to
	current fitness.
L	

1

2 Details of the exercise component of the intervention are provided in Table 2.

representing excessive effort that is very difficult to maintain. Patients with facilitators are encouraged to understand and gain experience of the effort scale and try to avoid too many occasions where patients go above a rating scale 7 on the effort scale. If the effort required during a period of sustained exercise (e.g. 3 or more mins) is rated as 8 or above then the next exercise period (intensity level) should be adjusted down to a lower level.

*Although the CBE has a defined warm up period of 6 to 7 mins per session all exercises in the main part of each CBE level are also steadily progressive allowing the muscles, joints and physiological responses to adapt with each minute of the exercise.

3 Usual care

Intervention and control patients will receive usual medical management as per clinical practice guidelines [3, 5] for treatment of participants with HFpEF. This includes the screening for both cardiovascular and non-cardiovascular comorbidities such as hypertension, diabetes mellitus, ischaemic heart disease and atrial fibrillation, which should be treated with safe and effective interventions that exist to improve symptoms, wellbeing, and prognosis. Diuretics are recommended in those who are congested to alleviate symptoms. As part of usual care, all patients in the trial will be provided with the British Heart Foundation 'Living with heart failure' booklet [16]. At the 4- and 12-month follow-up we will record any co-therapies received as part of usual care.

1	All primary and secondary outcomes will be collected at baseline (pre-randomisation)
2	and 4- and 12-months post-randomisation. At the time of follow-up patients will be
3	asked if they have had any adverse events. The PIs will be required to report serious
4	adverse events within 24 hours of becoming aware of the event to the
5	Pharmacovigilance Office. Any serious adverse events occurring during the trial will
6	be recorded and reported to the Ethics Committee and the Data Monitoring
7	Committee.
8	
9	Primary outcome
10	Patient disease specific HRQoL data will be collected at 12 months post-
11	randomisation through the MLwHF Questionnaire. This validated questionnaire
12	consists of 21 items to assess the impact of living with HF on the key physical,
13	emotional, social, and mental dimensions of quality of life [17]. It provides scores for
14	two dimensions, physical and emotional, and a total score.
15	
16	Secondary outcomes
17	Patients:
18	Exercise capacity (incremental shuttle walk test) [18]
19	Physical activity levels (accelerometry over a 9-day period, measured using
20	the GENEActiv Original accelerometer) [19]
21	Psychological wellbeing measured using Hospital Anxiety and Depression
22	Scale (HADS) questionnaire) [20]
23	Generic health-related quality of life using EuroQol EQ-5D-5L questionnaire
24	[21]
25	Generic health-related quality of life Short-Form-12 (SF-12)) [22]

38 39	16	Summary of study schedule is detailed in Figure 3.
40 41	17	
42 43	18	Sample size
44 45	19	At the design stage, the trial sample size was calculated in accordance with the
46 47 49	20	DELTA2 guidance [29]. A total of 520 (260 per group) participants with HFpEF is
40 49 50	21	required for 90% power at 5% significance to detect a mean difference on the
51 52	22	MLwHF Questionnaire of 5 points [17], assuming a standard deviation of 20 points
53 54	23	[13], a within patient correlation of 0.59 between baseline and 6-month follow-up,
55 56	24	and an attrition rate of 15%. A 5-point difference in MLwHFQ score represents a
57 58 59 60	25	minimum clinically important difference. Data from REACH-HFpEF pilot trial [13]

•

1 2 Page 19 of 46

BMJ Open

indicate that the correlation between baseline and 6 months will be at least 0.59 (estimated correlation 0.73, 95% confidence interval: 0.59 to 0.83). Prior to the final analysis, in January 2025, the trial sample size was reassessed. A recent publication [30] examining the responsiveness and minimal clinically important difference (MCID) of the MLwHF questionnaire suggested that a 16.6-point improvement represents a favourable outcome for patients. Based on a blinded access to trial data, specifically the overall distribution of changes in MLwHF scores, it was calculated that a mean between-group difference of 6.7 points in score at 12 months would equate to 50% more patients achieving a favourable outcome. Taking this as a minimally clinical important difference between groups, combined with the current baseline-adjusted residual standard deviation in 12-month MLwHF scores of 17.8 points, and the current 12-month retention rate of 81%, the required sample size for 90% power at 5% significance was calculated to be 372. The rationale and basis of this updated sample size calculation was reviewed approved by the TSC, DMC, and trial PPIE group. Trial data collection

BMJ Open

7. What adaptations were made within the service and did these impact fidelity and outcomes? The process evaluation will use mixed methods at multiple case levels (patient, facilitator, centre) to test the programme theory in the population with HFpEF, identifying which components and configurations are best suited to meet their needs [31, 32]. The process evaluation will identify refinements of the programme theory, to optimise implementation and ensure that the essential ingredients of future interventions are better identified, interrogated, and tested [33]. As the analysis progresses, the implementation strategy will be revisited focusing on potential outcomes such as Non-adoption, Abandonment, Scale-up, Spread, Sustainability (NASSS) Framework [34]. This will maximise the clinical application of our research findings and enhance the capacity of staff working with participants with HFpEF to implement the intervention. The participants in this process evaluation will comprise a subsample of patients, caregivers and REACH-HF facilitators taking part in the REACH-HFpEF trial. To answer the research questions, this mixed-method process evaluation will utilise trial primary and secondary outcomes and collect additional qualitative data (e.g., intervention session recordings and interviews). The process evaluation will utilise multi-modal longitudinal data [35, 36]. Process evaluation 1: Participants and caregivers experience 15-20 patients (and 10 caregivers of these same patients) will be purposively selected and invited to take part in semi-structured interviews. Patients will be chosen to represent, for example, diversity in terms of site/facilitator, sex, ethnicity, presence of a caregiver and baseline MLwHF Questionnaire total score.

BMJ Open

The research team will interview each of these patients/caregivers at 4-months after the baseline visit (i.e., immediately after intervention delivery is complete) and 12-months after the baseline visit. This will allow capture of patient and caregiver narratives over time, in relation to both intervention receipt and the longer-term impact/maintenance of self-care following the intervention. We will audio or video record these interviews, which may be conducted in person (if possible) or remotely (if not). Recording will use encrypted recording methods (either via password-protected online meeting software or an encrypted voice-recorder). Written consent will be obtained prior to face-to-face interviews. Topic guides for the interviews have been co-developed with the patient and public involvement (PPI) advisory group. Interviews are designed to last between 30 to 60 minutes. The researcher will endeavour to interview the patients without the caregiver present, where possible, and be mindful of the patient's symptoms, such as fatigue or breathlessness, which may make an interview burdensome for the participant. The two interviews (and potentially selected segments of the intervention session recordings which represent good practice), will be transcribed verbatim. Thus, for each patient, their qualitative dataset is likely to comprise: two face-to-face meetings with their facilitator, 5 telephone meetings with their facilitator and two interviews with the process evaluation team. Process evaluation 2: REACH-HF facilitator's experience In addition, 15 REACH-HF facilitators will be invited to take part in the process evaluation. The process evaluation team will send an email to the participating facilitators with a

- brief questionnaire about their clinical background. This short questionnaire will
- either be completed in an electronic Word document and returned via email, or by

Page 23 of 46

BMJ Open

following a link in the email to an electronic questionnaire (e.g., using the electronic questionnaire platform Qualtrics). The process evaluation team will endeavour to sample REACH-HF facilitators to represent diversity in, for example, site, background training (e.g., physiotherapy, nursing) and years of experience in delivery of cardiac rehabilitation (gathered using the clinical background guestionnaire, see above). A topic guide will inform the interview, premised on the existing literature and gaps in current knowledge about intervention delivery. These interviews will be conducted either in person or remotely via by telephone/web-call. Verbatim interview transcripts will be organised and coded using MAXQDA. A framework analysis will be conducted, and sections of data relating to the aims of this research will be assigned a code that summarizes the content either descriptively or interpretively. Codes with common features will be grouped together in themes, before finally being assigned to overarching themes. Where possible, data about self-reported behaviour from the interviews will be compared with observed behaviour evident in the intervention session recordings. A second qualitative researcher from the team will conduct independent analysis of a subset of the data. The researchers' reflexive memo notes will enhance the integrity of the analysis. The analysis will characterise patients' and caregivers observed and self-reported responses to the intervention and link these responses to engagement with intervention and perceived benefit, identifying interpersonal processes that shape effectiveness or ineffectiveness of the intervention. At 4-months, patients', and caregivers' engagement with, response to and use of the REACH HF Manual will be characterised and differences between patients noted. At 12-months, overall use and benefit and maintenance of self-care behaviours and coping skills will be

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

characterised and linked to individual differences in 4-month responses. Analysis will
explore both patients' and caregivers' experiences of participation in the intervention
and explicitly examine any potential impact of caregiver presence on patient
adherence to the REACH-HF intervention.

Process evaluation 3: Fidelity of intervention delivery

Facilitator-patient interactions (face-to-face and phone) for up to 60 patients will be audio-recorded (approximately 5-6 interactions taking 4-5 hours per patient). Recordings will be assessed using a previously developed and tested fidelity assessment checklist [8]. The 12-item checklist uses a 0-5 rating scale based on the Dreyfus scale for assessing clinical competence [37]. It focuses on assessing the quality of delivery of key delivery processes, such as the use of a patient-centred communication style, making a plan of action and encouraging self-monitoring of progress (particularly with the exercise programme). Intervention delivery fidelity data will be presented descriptively (mean scores with standard deviations or 95%) Cls) and broken down by site and by facilitator (as well as the calculation of overall delivery fidelity scores) for each checklist item. This will clarify how well intervention components were delivered and may identify ways to optimise delivery for future implementation. It will also allow researchers to describe variability in fidelity of delivery across patients and facilitators.

In addition, segments of the recordings that represent clear examples of good
practice associated with each component of delivery (each item on the checklist) will
be identified by noting the start /end timestamps of the segment within the audio file.
These segments will be transcribed and collated for informing future REACH-HF
training. Any information that might be used to identify the patient or the facilitator
within the transcript will be redacted.

BMJ Open

We will report descriptive statistics to summarise the fidelity of intervention delivery for each checklist item and will (descriptively and anonymously) examine variations between sites. Synthesis of the analysis of the intervention delivery fidelity and the interview data will enable a qualitative evaluation of potential pathways and barriers to improvement, which will pay attention to discrepancies between expected and observed outcomes, to understand how context influences outcomes, and to provide insights to aid future implementation.

8 Process evaluation 4: Facilitator checklist and log

REACH-HF facilitators will be asked to complete a brief self-rated fidelity checklist after each session they deliver. This comprises questions about the same 12 delivery fidelity components described above and allows the facilitators to rate the occurrences of each feature (absence, minimal, some, sufficient, good, very good, excellent). An independent observer-rating is resource-intensive, while self-rated assessment may provide a pragmatic, real-world alternative to monitor delivery guality. The validity of the self-rating method will be checked by examining the correlation with observer-rated intervention delivery fidelity. We will also explore in the gualitative interviews whether use of the checklist facilitates /encourages reflexive practice and, in doing so, quality of implementation. Additionally, facilitators will be asked to complete a facilitator contact log for each participant. This log is a one-page pro forma designed to capture time, expenditure and any other resources required for the implementation of REACH-HF, as well as any adaptations made to the intervention for individual patients. It will capture data for both assessment of the fidelity of REACH-HF delivery and economic analyses. A detailed process evaluation analysis plan will be drafted prior to study data lock and agreed with the Trial Management Group and Trial Steering Committee.

2		
4	1	
5 6	2	Economic evaluation
/ 8 0	3	Economic analysis will be performed to establish the cost-effectiveness of REACH-
10 11	4	HF plus usual care compared to usual care alone. Following on from the results of
12 13	5	the economic evaluation pilot study [13] a within-trial cost-utility analysis will be
14 15	6	conducted. Pilot study findings revealed differential resource distributions across
16 17 18	7	primary, secondary and social care as well as impacts on informal carer time and
19 20	8	costs. Bespoke data capture instruments have been developed to ensure capture of
21 22	9	all relevant resource use from both an NHS/Personal Social Services (PSS)
23 24 25	10	perspective, as well as a broader societal perspective. There is evidence of
26 27	11	insensitivity of the EQ-5D-5L in patients with mild HF [36, 38-41]. A recent study
28 29	12	comparing the EQ-5D-5L and short-form six-dimension (SF-6D) in elderly
30 31 32	13	participants with HF recommends use of SF-6D in those with milder disease and
32 33 34	14	economic outcomes [42]. Therefore, we propose to use both the SF-6D (from SF-12)
35 36	15	and the EQ-5D-5L. As recommended by NICE economic evaluation guidance, the
37 38	16	base-case perspectives will be that of the UK NHS and PSS [43]. Further, a broader
39 40 41	17	societal perspective, accounting for resource use, productivity (employment) and
42 43	18	personal cost impacts faced by patients and their carers will be considered in
44 45	19	sensitivity analyses, along with a scenario analysis incorporating HRQoL values
46 47 48	20	obtained from mapping MLwHF Questionnaire scores to EQ-5D utilities, using a
49 50	21	validated mapping algorithm [44, 45]. The base case economic evaluation will
51 52	22	estimate the incremental cost per QALY associated with the REACH-HF
53 54 55	23	intervention, compared to usual care alone, and will be reported in line with updated
55 56 57	24	reporting guidelines for economic evaluations [46]. The wider societal perspective
58 59 60	25	will incorporate resource use, productivity (employment) and personal costs.

25 | Page

 BMJ Open

Missing resource use and outcome data will be handled using multiple imputation [47]. If within-trial results reveal between-group differences in HRQoL, a decision analytic model will be developed to estimate the cost-effectiveness results over a lifetime horizon.

A detailed health economic analysis plan (HEAP) will be drafted prior to study data lock and agreed with the Trial Management Group and Trial Steering Committee.

Statistical analysis

Participation from screening to completion of the final follow-up assessment will be reported. Baseline patient characteristics and outcome scores will be summarised descriptively.

The primary statistical analysis for both primary and secondary outcomes will take an intention to treat approach (according to randomised allocation) based on complete data. For continuous outcome measures, mixed-effects regression will be used with a random effect of recruiting site and adjusting for baseline outcome score and minimisation variables. Additional clustering of outcomes due to therapist effects will be accounted for in sensitivity analyses. A number of secondary analyses will be undertaken. Patterns and reasons of missing outcome data will be assessed, and sensitivity analyses will use appropriate imputation models to assess the impact of missing data. Potential subgroup treatment effects will be explored by adding treatment-by-subgroup interaction terms to analysis models. Potential subgroups assessed will include sex, study site and

participant baseline NT-proBNP levels, ejection fraction, and important markers of

- inequity, such as age, socio-economic status, and having a carer. Since the trial is
- powered to detect overall differences between the groups rather than interactions of
Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, AI training, and similar technologies.

this kind, these subgroup analyses will be regarded as exploratory. Before the start of recruitment, the TMG (with TSC approval) will be asked to define the minimum adherence to the REACH-HF intervention required to indicate compliance. Complier average causal effects analyses will be used to estimate the causal intervention effect in relation to each outcome. Adherence will be defined using criteria adapted for the delivery processes proposed for the current study. These criteria will be developed with the Trial Management Group, building on the criteria used in the prior multicentre REACH-HF trial in people with HFrEF [11]. Associations between physiological, cognitive and demographic factors and intervention adherence will be explored. Estimated between-group differences will be presented using both absolute and relative measures, with associated 95% confidence intervals, where appropriate. No correction of P-values for multiplicity of testing will be undertaken. However, the analysis for the primary outcome will be performed before all other analyses and the P-values of all subsequent analyses interpreted in the context of multiple testing. No interim analyses are planned. Safety/adverse event outcomes will be reported descriptively by group. A detailed statistical analysis plan will be drafted prior to study data lock and agreed with the Trial Management Group and Trial Steering Committee. Sub-studies Three pre-specified sub-studies are being undertaken alongside the main REACH-HF trial. Study Within a Trial (SWAT): The objective of the SWAT is to determine if an evidence-based enhanced participant information sheet impacts on

27 | Page

Page 29 of 46

1

BMJ Open

2		
3 4	1	recruitment and retention of caregivers to a multi-centre host trial. Embedded
5 6	2	in the main trial, the SWAT will be a cluster RCT design with allocation of the
7 8	3	trial sites to either the enhanced host trial caregiver PIS (SWAT intervention
9 10 11	4	group) or the standard host trial caregiver PIS (SWAT control group). The
12 13	5	SWAT is led by University College Dublin, is registered with the ISRCTN trial
14 15	6	registry (ISRCTN15757498) and with the MRC SWAT Repository
16 17 19	7	(https://www.qub.ac.uk/sites/TheNorthernIrelandNetworkforTrialsMethodology
19 20	8	Research/FileStore/Filetoupload,1218962,en.pdf). The SWAT protocol will be
21 22	9	submitted for publication separately.
23 24 25	10	> Optimisation of Exercise Fidelity in Home-Based Cardiac Rehabilitation Study.
25 26 27	11	This sub-study aims to apply novel indicators of exercise fidelity (i.e. quality of
28 29	12	exercise in relation to the exercise prescribed) in the participants with HFpEF
30 31	13	participating in the main trial. By identifying measurable indicators of exercise
32 33 34	14	fidelity and associate them with patient outcomes, the sub-study intends to
35 36	15	identify ways to assess and tailor future home-based exercise interventions.
37 38	16	Assessing the quality of the patients' exercises might also give them useful
39 40 41	17	feedback about their progress and how they can get more benefit from the
42 43	18	exercise component in future implementations of the REACH-HFpEF (or other
44 45	19	home-based exercise interventions). This sub-study is led by University of
46 47 48	20	Birmingham.
49 50	21	This sub-study will seek sample of up to 80 intervention group patient participants
51 52	22	with a tracker watch and mobile phone and a brief questionnaire, These will be
53 54	23	used to a) measure resting heart rate pre and post intervention b) monitor heart
55 56 57	24	rate during all their REACH-HFpEF exercise sessions and c) video-record 1-2
58 59	25	exercise sessions to check for safety and accuracy-of-Quantitative

Mediation Analysis: The proposed statistical mediation sub-study will form an extension of the main trial process evaluation and aims to assess the association of the change of secondary outcomes as potential mediators of the REACH-HFpEF intervention primary outcome measure (MLwHF questionnaire). This substudy is led by University of Exeter.

8 Data monitoring and quality assurance

Trial-specific work instructions will be developed in accordance with University of Glasgow Clinical Trial Unit procedures. Regular data management and cleaning will be undertaken to assess data quality. Quality assurance checks will be undertaken to monitor the level of missing data and the timeliness of data entry and check for illogical or inconsistent data. The research team will monitor data collection procedures, ensuring that study data entry procedures are followed. The sponsor has categorised this trial as low risk and will therefore not be routinely monitored. The trial may be subject to audit by the sponsor.

18 Trial management and independent committees

The Trial Operations Group (TOG) team members directly involved with the day-today running of the trial (co-chief investigators [CC/RST] and trial managers
[EB/COH/AP/ET] and trial administrator) will meet on a two weekly basis to monitor
discuss the day-to-day management and all aspects of progress of the study. The
TOG will have regular contact with trial sites by email and webinar meetings. The
Trial Management Group (TMG) including the health economics, statistics, process

Page 31 of 46

 BMJ Open

evaluation teams, co-applicants, and PPI representation will meet on a termly basis to review status of the study and trial progress. The REACH-HFpEF Trial Steering Committee (TSC) consists of independent members with clinical and trial methodological expertise and includes a patient and public involvement representative. The TSC will provide independent oversight of the conduct, timelines and funding of the trial with safety and ethics review by an independent Data Monitoring Committee (DMC). The TSC and DMC will normally meet one to two times per year. Detailed descriptions of the remit and function of the committees are documented in specific charters held in the Trial Master File by Glasgow Clinical Trials Unit. Patient and public involvement A PPI group will be established for this trial: 12 participants with lived experience of HFpEF and their partners/carers. These patients are usually managed and monitored in general practice [12]. We will advertise on the NIHR People in Research website to recruit these patients and their partners/carers to the PPI group. An induction webinar will be held to introduce the group to the study and to negotiate characteristics of the PPI role throughout the study, including training and support needs. Additionally, PPI representatives were members of the Trial Management Group and Trial Steering Committee. Ethics and dissemination The study will be conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and that are consistent with ICH GCP, and in

30 | Page

Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, AI training, and similar technologies

BMJ Open

accordance with the Research Governance Framework for Health and Social Care, Second edition (2005). The study and all relevant study documents have been reviewed and approved by the West of Scotland Research Ethics Service (reference number 21/WS/0085). The study sponsor is The NHS Greater Glasgow and Clyde. Written informed consent will be obtained from all study participants by the PI or designee prior to enrolment to the trial. All protocol modifications are being communicated to REC, funder, sponsor, TSC & DMC. Study results will be published in open access publications in high impact peer-reviewed journals, including an end of trial NIHR monograph, and will be presented at national and international conferences. The study will be featured at stakeholder dissemination workshop (with patients, clinicians, commissioners, academics, and key groups such as British Heart Foundation, British Association for Cardiovascular Prevention and Rehabilitation (BACPR) and Pumping Marvellous). Direct feedback will be given to trial participants and information will be digitally publicised on REACH-HF website and relevant profiles on social media platforms. **Trial status** The first participant with HFpEF was recruited in May 2022. At the time of submission, the trial has opened at 20 sites in England, Scotland, and Wales (see

20 appendix for listing) and has recruited 308 participants with HFpEF and 82

21 caregivers.

1 | P a g e

Inclusion criteria:	
 Women or men aged ≥18 years; 	
 Patients with currently symptomatic HF (NYHA Class II-IV) 	
 Patients with prescribed loop diuretics and the need for intermit for the management of symptoms or signs of congestion 	tent loop diuretics
 ◆ Patients with left ventricular ejection fraction (within 3 years by MRI) ≥45% prior to randomisation; 	echocardiography or
 Patients with at least one of the following risk factors: 	
 Hospital admission in last 3 years for which HF was a major of N-terminal proBNP >300 pg/ml for patients with sinus rhyth N-terminal proBNP >900 pg/ml for patients in atrial fibrillation Able to provide informed consent to participate. 	contributor. m in last 3 years. on in last 3 years.
Exclusion criteria:	
 Patients who have undertaken CR within the last 12 months; 	
 Patients who have any contraindications to exercise training (acc cardiac rehabilitation guidelines); 	cording to local
 Probable alternative diagnoses that in the opinion of the investig for the patient's HF symptoms (i.e. dyspneoa, fatigue), such a pulmonary disease (including primary pulmonary hypertensio obesity. Specifically, patients with the following conditions wi a. Severe pulmonary disease including COPD (i.e. requiring h nebulizer therapy, or chronic oral steroid therapy or hospita decompensation within 12 months) 	gator could account s significant on), anaemia, or ill be ecluded: nome oxygen, chronic lised for pulmonary
b. Haemoglobin <10 g/dll	
c. BMI >40 kg/m²;	
 Patients with prior ejection fraction <45%. 	
 Patients located in a long-term care home/support setting who a too frail to engage with the intervention or who are unwilling assessments or accommodate home visits. 	are considered to be to travel to research
 Patients who are unable to understand the study information or 	unable to complete
the outcome questionnaires.	
 Patients judged to be unable to participate in the study for any o psychiatric disorder, diagnosis of dementia, life-threatening c 	other reason (e.g. o-morbidity).

1.	I confirm that I have read and understood the information sheet (version x.x, dated xx/xx/xxxx) for the REACH- HFpEF study. I have had the opportunity to consider the information provided to me, ask questions and have had these answered satisfactorily.	
2.	I understand that my participation in this study is voluntary and that I am free to stop taking part at any time without giving any reason and without my medical care or legal rights being affected. If I decide to stop participating in this study, I understand that any data already collected about me will be retained and used by the research team.	
3.	I understand that relevant sections of my medical notes and data collected during the study will be looked at by individuals from the research team within the Universities of Glasgow, Exeter and Birmingham, NHS Tayside, from regulatory authorities, and from NHS Greater Glasgow and Clyde (the sponsor of the study), where it is relevant to my taking part in this research. I understand that this data will be held in a database at the University of Glasgow.	32
4.	I agree that my contact details (name, postal address, email address, and phone number) can be retained by the study team for use in relation to study procedures, and will be stored separately on a secure University of Glasgow server (secure online database). I understand that University of Exeter will be provided with my contact details to send me the GENEActiv accelerometer.	

	Participant	ID				
5.	I agree to the information I give being shared with other researchers for research and teaching, in line with a University of Glasgow data sharing agreement. I understand that anonymous data from my questionnaires will be deposited in a repository such as the UK Data Service, and that I will not be identified in any data shared.					
6.	I agree to my blood samples being transferred to NHS Tayside, Dundee for analysis.					
7.	I agree to my GP being informed about my participation					
8.	I agree to take part in the REACH-HFpEF study.					
Ор	otional Consents:			Yes	'No	
1.	I agree to be interviewed by a member of the research team about my experience in receiving the intervention and ways in which it can be improved. I understand that this recording will be held securely at the Universities of Birmingham and Exeter. I understand that members of the research team at the Universities of Birmingham and Exeter will have access to my contact details in order to facilitate this process.	Yes	3		No	
2.	I agree that the study team may contact me again at a later date (after completion of the REACH-HFpEF study) to ask me to complete an additional follow-up questionnaire or provide related information.	Yes	3		No	
3.	I understand that sessions with my REACH-HF facilitator may be audio recorded and listened to by					

4. I agree my anonymised audio recordings from the intervention delivery that are selected to represent good practice can be used for training and education purposes

recordings will be held securely at the Universities of

Birmingham and Exeter.

Yes

No

5.	I agree to additional blood samples being taken and stored for use in future, ethically approved research.	Yes No
6.	I agree to long term follow-up information by record linkage being collected on my future wellbeing and treatment from NHS and Government health records. I understand that this information will be stored confidentially and securely at the University of Glasgow for further analysis by approved researchers, up to a period of 10 years after the study has finished. I agree that personal details including my NHS/CHI number, date of birth and postcode can be used to facilitate this process. Researchers will only be allowed access to anonymised information. This may include information on prescriptions, hospitalisations and test results.	Yes No
7.	I would like to receive a copy of the final study results	Yes No
8.	I agree to be contacted about an exercise fidelity sub- study if I am offered the REACH-HF programme. I understand that my contact details (name, phone number and address) will be shared with the sub-study research team at the University of Birmingham to allow them to make contact with me. I understand that by agreeing to be contacted, I am under no obligation to take part in the sub-study.	Yes No
	Ç	

To be scanned together with confirmation of consent and a pdf file produced for the study records, with a copy being sent back to the patient, and a copy being inserted into the patient's notes.
