## ABSTRACT

**Objective:** To assess the clinical status of chronic spontaneous urticaria (CSU) and to understand treatment approaches in Italy through both specialists who treat CSU (dermatologists and allergy specialists) and CSU patients' experience.

**Design:** Multicenter survey

Setting: Online structured questionnaires (one for physicians and one for patients)

Participants: Physicians and patients in Italy

Interventions: None

Primary/secondary outcomes: Physician and patient attitudes/experiences

**Results:** Survey results from 160 allergy and 160 dermatology specialists show that specialists see a median of 40 (interquartile range [IQR] 20–80) patients/year. While most specialists (56%) know the CSU guidelines, only 27% use them regularly (36% of allergy specialists vs 18% of dermatologists). This is reflected in treatment choices: while 77.2% of specialists choose standard-dose, non-sedating antihistamines as first-line treatment, only 64.4% would select up-dosing for second-line. Subsequent-line treatments differ widely, often not conforming to the guidelines. The diaries from 1385 patients highlight that, regardless of treatment regimen, 29.4% of currently treated patients are refractory to therapy. Specialists aim to resolve symptoms, and only 7.8% report improving quality of life (QoL) as a priority. Knowledge and use of tools for assessing disease activity are unsatisfactory: 46.9% of specialists do not know the Urticaria Activity Score and only 16.6% are familiar with and utilize it. Overall, 537 patients with CSU were surveyed (median age 37 years, IQR 30–46; 44.3% male;

#### **BMJ Open**

median disease duration 5 years, IQR 3–20). Approximately 62% confirm that CSU negatively impacts their QoL. Patients also complain of difficulties in getting information and support: less than 5% of medical centers provide patient support services.

**Conclusions:** In Italy, the gap between guideline-based care and QoL-related needs in CSU patients affects treatment satisfaction. This information could be used to improve the management of CSU in Italy.

#### Article summary

Strengths and limitations of this study

- A strength of the study is the representative sample of both specialists who treat CSU and patients with CSU in Italy, giving insight into the management of this condition from dermatologists' and allergists' experience
- Limitations include those inherent to the survey/questionnaire format such as subjective bias

#### 

# INTRODUCTION

Urticaria is a disease characterized by the spontaneous development of wheals (papules or plaques), angioedema or both, that is associated with itching, a burning sensation and/or pain.[1] Wheals typically resolve within several hours to a day with no residual appearance. Angioedema is also sudden in appearance, but the swelling of the subcutaneous (lower dermis and subcutis) or submucosal tissues is associated with pain rather than itching, and a slower resolution than that for wheals, generally up to 72 hours.[1]

Most cases of urticaria tend to be acute (<6 weeks); however, urticaria lasting for 6 weeks or more is considered chronic and is further classified as two subtypes, chronic spontaneous urticaria (CSU) and inducible urticaria. The cause of the spontaneous appearance of daily or episodic wheals, with or without angioedema, in CSU can be known or unknown,[1] and symptoms can last for more than 5 years.[2, 3]

An estimated 0.5–1% of the population, including children and adults, may be affected by CSU.[2, 4] CSU is associated with a large societal burden, an impact on patients' personal life, reduced work performance and direct and indirect healthcare costs.[5]

The care of patients with CSU is challenging because of the frequent lack of an underlying cause, the unpredictable disease course, the high disease burden, and the often limited efficacy of approved therapies.[5] Furthermore, CSU can have a significant impact on the patient's quality of life (QoL), and patients with CSU often experience depression and anxiety related to the disease.[4, 6-8] Failed attempts to treat long-term symptoms can often lead to frustration on the part of both the patient and the physician,[5] and patients with long-term unresolved symptoms often present to a

number of physicians in varying specialties in an attempt to seek relief.[4]

Data regarding CSU in Italy are currently limited. This survey aimed to assess the clinical status of CSU in Italy from the perspective of specialists who treat CSU (dermatologists and allergy specialists) and patients who have the disease. Both the specialists' therapeutic approach and the patients' experiences were assessed, with a focus on potential barriers to diagnosis and treatment that patients with CSU in Italy may experience.

## **METHODS**

#### Study design

This multicenter Italian survey comprised two questionnaires, one for physicians and one for patients with CSU. Only data from patients and physicians who accepted to be interviewed were collected. Survey results were collated and analyzed by an independent market research company (Stethos Marketing Research, Milan, Italy) and stratified according to geographical area and hospital/center size. Due to the qualitative nature of these surveys, no inferential analyses were performed.

The research was conducted in conformity with the Code of Conduct 2014 of the European Pharmaceutical Market Research association (EphMRA).

#### Physician survey

Data were collected from a sample of physicians, specifically specialists in dermatology or allergy, to assess their diagnostic-therapeutic approach to CSU. Physicians and centers were selected from a proprietary database of Stethos Marketing Research. In order to obtain a good level of confidence, 320 physicians from across Italy who were directly involved in the diagnosis and treatment of CSU were enrolled.

BMJ Open: first published as 10.1136/bmjopen-2016-012378 on 14 October 2016. Downloaded from http://bmjopen.bmj.com/ on June 14, 2025 at Agence Bibliographique de Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

Physicians were asked to complete a survey exploring their approach to the management of CSU and also provided completed patients diaries. The survey, consisting of 29 questions, was conducted online using Computer-Assisted Web Interviews (C.A.W.I.) with self-administered structured questions in Italian. The questions explored the characteristics of patients with CSU seen in the clinical practice, the treatments used and the criteria for their choice, the perceived goals and main drawbacks of therapy and the level of knowledge of existing guidelines. The specialists completed online Web Patient Diaries for the last five CSU patients examined during the study reference period. The objective was to collect at least 1000 patient diaries to allow for a robust dataset. This sample of interviewees was to be representative of the population of the CSU specialists in Italy, with a maximum margin of error of  $\pm 5.3$  and a 95% confidence interval (CI).

### **Patient survey**

The patient sample was targeted to ensure a good distribution by geographical area and size of the treating hospital. This was achieved by ranking the centers by the number of CSU patients being treated: the centers with the highest number of patients were selected. A random sample of patients with CSU being treated in each of these centers was asked to participate in the survey, before/after a routine assessment at the dermatology/allergy department. Planned enrolment was about 500 patients with CSU (an average of 4–5 patients from each center). This sample of respondents to the patient survey was to be representative of the population of patients with CSU in Italy (0.5–1% of the Italian population), with a maximum margin of error of  $\pm 4.2$  and a 95% CI.

The patient surveys were self-administered via a C.A.W.I. system platform, and comprised of 46 questions, including those where the respondents could provide

demographic details, disease characteristics and disease history, rate their QoL and their treatment satisfaction. To investigate the journey of a patient with CSU arriving at a dermatology/allergy hospital center, the survey questions aimed to identify the steps followed and the possible barriers encountered during the diagnostic and therapeutic pathway, and to assess the impact of the condition on the patients' QoL.

## RESULTS

#### Specialist perspective

Demographic distribution of the specialists

In total, 320 (160 allergy and 160 dermatology specialists) physicians from 194 centers in Northern (35.1%), Central (26.8%) and Southern (38.1%) Italy participated in the survey, and collected 1385 online patient diaries. The data were collected from January 29, 2014 to April 7, 2014. The distribution of allergy and dermatology specialists working in hospital practice (18.8% vs 16.9%), both hospital and private practice (49.4% vs 40.0%), or private practice only (31.9% vs 43.1%), was similar between groups.

Patients managed by the specialists

The allergy and dermatology specialists reported managing a median of 40 (IQR 20–80) patients with CSU annually, among whom the incidence of angioedema was 35.9%. Almost half of the patients treated by these specialists (as assessed by evaluation of the 1385 patient diaries) were considered to have severe disease (n=681; 49.2%); the remaining patients were considered to have mild CSU (n=704; 50.8%). The distribution of patients in relation to disease severity did not change when the patient data from allergy and dermatology specialists (n=662 and n=723, respectively) were assessed

BMJ Open: first published as 10.1136/bmjopen-2016-012378 on 14 October 2016. Downloaded from http://bmjopen.bmj.com/ on June 14, 2025 at Agence Bibliographique de Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

separately. The number and frequency of the patients symptoms were considered the key parameters for determining disease severity by both specialist groups, while the impact of CSU on patients QoL, the efficacy of the therapy and the comorbidities were deemed relevant by fewer specialists.

Among all the patients managed by the surveyed specialists, 39.3% had symptoms that appeared frequently and regularly; more patients with severe disease reported frequent and regular symptoms (49.0%). The majority of patients (71.7%) had frequent symptoms, with or without regularity. In patients with mild disease the symptoms tended to manifest in an unpredictable manner (Figure 1).

Patient referral and disease diagnosis

Data from the patient diaries showed that patients were commonly referred to a CSU specialist by a general practitioner (32.6%), after visitation to the emergency department (21.2%), or, in 20.9% of patients, they sought a specialist themselves when symptoms appeared. Some patients were referred to the allergy and dermatology specialists by other specialists, including dermatologists (11.0%), allergy specialists (6.0%), or other specialists (2.2%). It was unknown how the remaining patients (6.2%) were referred to the specialist. The first symptoms referred by patients to specialists were hives (47.9%), itching (47.7%), urticaria (37.5%) and angioedema (24.8%). The latter was most frequently referred by severe patients (33.2%) compared to mild patients (15.9%). The diagnosis of CSU was established by a dermatologist in 67.3% of cases (either the surveyed [46.0%] or previous [21.3%] dermatologist) and an allergy specialist. General practitioners (10.0%) or other specialists (0.4%) were involved markedly less frequently in diagnosing CSU. Among the 320 specialists surveyed, the diagnosis of CSU was

#### **BMJ Open**

established an average of 7 months (median of 4 months, IQR 2–10.5) after the onset of the first symptoms in patients.

Symptomatic treatment of chronic spontaneous urticaria

When queried about the "ideal sequence" of symptomatic treatment for a patient with CSU (reflecting the approved indications at the time of the survey, in 2014), the majority (77.2%) of all specialists surveyed indicated that a standard dose of a non-sedating antihistamine was ideal as first-line treatment, while an increased-dose (<4 times the standard dose) non-sedating antihistamine was selected by 64.4% of specialists for second-line treatment. While 45.1% of specialists chose an increased-dose non-sedating antihistamine in combination with a leukotriene antagonist (LTRA)/H<sub>2</sub>-antihistamine as third-line treatment, 36.1% indicated an increased-dose non-sedating antihistamine in combination with steroids would be an ideal third-line treatment; 30.9% of physicians indicated that they would reserve the latter as fourth-line treatment. 54.9% chose an increased-dose non-sedating antihistamine in combination with steroids would be an ideal third-line treatment. 54.9% chose an increased-dose non-sedating antihistamine in combination with steroids would reserve the latter as fourth-line treatment. 54.9% chose an increased-dose non-sedating antihistamine in combination with steroids would reserve the latter as fourth-line treatment. 54.9% chose an increased-dose non-sedating antihistamine in combination with steroids would be an ideal third-line treatment.

For the 1157 (83.5%) patients with CSU seen by the allergy and dermatology specialists who were receiving treatment at the time of the survey, the majority received a standard dose non-sedating  $H_1$ -antihistamine or increased-dose non-sedating  $H_1$ -antihistamine (Figure 2a). Fewer patients were receiving an increased-dose non-sedating antihistamine either in combination with steroids, cyclosporine,  $H_2$ -antihistamine, LTRA/ $H_2$ -antihistamine or LTRA (Figure 2a).

Comparing patients who had mild and severe disease, increased disease severity was associated with more complex treatment regimens, predominantly increased-dose nonsedating antihistamine in combination with steroids or cyclosporine. While standard-

BMJ Open: first published as 10.1136/bmjopen-2016-012378 on 14 October 2016. Downloaded from http://bmjopen.bmj.com/ on June 14, 2025 at Agence Bibliographique de Enseignement Superieur (ABES)

Protected by copyright, including for uses related to text and data mining, AI training, and similar technologies

dose non-sedating antihistamines were used as treatment for patients with mild disease, markedly fewer patients with severe disease received this treatment (Figure 2b).

Refractory chronic spontaneous urticaria

Regardless of the type of treatment received, 29.4% of all the patients with CSU currently treated were refractory to their therapy when the survey was conducted. Examining unresponsiveness for each current treatment showed that increased treatment was associated with increasing rates of unresponsiveness/disease severity (Figure 3).

Treatment goals

For the specialists surveyed, the main goal of treatment was to reduce the symptoms of CSU, in particular itching (87.8%) and hives (46.2%). Only 7.8% of physicians reported improving QoL as a priority, although 15.0% did consider this a second priority. Generally there were no significant differences between allergy and dermatology specialists for treatment goals, except for a greater tendency of allergy specialists to report improvement of QoL as a second treatment goal (15.0%) compared with dermatologists (10.0%).

#### Treatment guidelines

Among the 320 specialists surveyed, 56% were familiar with and used CSU guidelines; however, only 27% did so regularly. Compared with dermatologists, allergy specialists were twice as likely to regularly use guidelines (18% vs 36%, respectively) and knew of the CSU guidelines (45% vs 73%, respectively). Of those 189 specialists who confirmed that they knew CSU guidelines, the most commonly known were those by the European Academy of Allergy and Clinical Immunology (EAACI; 32.8%) and Associazione Allergologi Immunologi Territoriali e Ospedalieri (AAITO; 21.7%).[1, 9]

#### **BMJ Open**

Regarding the main scales used worldwide to assess and define the level of severity of CSU, 46.9% of the specialists did not know the Urticaria Activity Score (UAS). Although 36.6% knew of the scale, only 16.6% were familiar with and utilized the scale. Furthermore, 51.6% of the specialists did not know the UAS 7 days (UAS7), which uses the sum of the daily UAS scores to supply a weekly UAS value, and only 6.6% used it. Finally, only 16.9% of the specialists surveyed were familiar with and utilized the Chronic Urticaria Quality of Life Questionnaire (CU-QoL).

There were no significant differences between the allergy and dermatology specialists in the familiarity and utilization of the UAS/UAS7 scales; the proportion of specialists who were unfamiliar with the UAS (41.9% and 51.9%, respectively) and UAS7 (48.1% and 55.0%, respectively) scales was high in both groups.

Complexity of disease diagnosis

When all the specialists were asked to rate the level of complexity in diagnosing CSU on a scale of 1 to 10, where 1 = not at all complex to 10 = extremely complex, 40% considered that there was a high level of complexity ( $\geq 8$ ) in diagnosing CSU. When the 210 specialists who rated the level of complexity as >5 were queried about the elements that increase the complexity of diagnosing CSU, over half (55.2%) chose 'several tests to diagnose CSU', while 44.3% responded that it was due to 'the great difficulty in identifying the cause of the pathology'; there were no significant differences in the responses to this questions between the allergy and dermatology specialists.

A quarter of all specialists surveyed (n = 83) revealed that they consult with another specialist, and there is generally a high level of collaboration between allergy and

dermatology specialists. In 95.3% of cases, the dermatologists requesting a colleague's opinion will turn to an allergy specialist, whereas 62.5% of allergy specialists will request a dermatologist's opinion and 70.0% the opinion of another allergy specialist.

#### **Patient perspective**

Demographic and disease characteristics

In total, 537 patient surveys were conducted between May 6, 2014 to June 12, 2014. The patients who responded to the survey (55.7% female) had mean age of 39 years (median 37 years, IQR 30–46). Mean and median ages were similar between men (mean 39 years; median 38, IQR 31–46) and women (mean 39; median 37 years, IQR 29–46). Almost 84% of respondents were aged 50 years or under (Table 1).

 Table 1. Baseline demographic characteristics of patients with chronic spontaneous

 urticarial (CSU).

Characteristic or demographic	Patient survey	
Characteristic of demographic	respondents (N=537)	
Gender, n (% patients)		
Female	299 (55.7)	
Male	238 (44.3)	
Age group, n (% patients)		
$\leq 30$ years	139 (25.9)	
31–40 years	175 (32.6)	
41–50 years	135 (25.1)	
51–60 years	66 (12.3)	
>60 years	22 (4.1)	
Geographical region, n (% patients)		
North-West	141 (26.3)	
North-East	61 (11.4)	
Centre	106 (19.7)	
South	229 (42.6)	
Disease severity, n (% patients)		
Mild	120 (22.3)	
Moderate	323 (60.1)	
Severe	56 (10.4)	

At the time of the survey, patients had an average disease duration of 13 years (median 5 years, IQR 3–20) and 45.6% of patients had lived with the disease for 2–5 years (Table 1). The majority of patients surveyed had moderate disease (Table 1).

Impact of chronic spontaneous urticaria on quality of life

Almost two-thirds (61.6%) of patient respondents indicated that their CSU had a negative impact on their QoL, with a rating of 4–6 (where 1 = no impact on QoL to 6 = significant impact on QoL), while only 4.3% reported the CSU had no influence on their QoL. The frequency of patients rating the impact of CSU on their QoL as  $\geq$ 4 to 6 varied with disease severity, from a minimum of 35.8% of patients with mild disease to 70.0% and 80.4% of patients with moderate and severe disease, respectively. One third (33.9%) of patients with severe CSU rated the level of disease influence on their QoL as 6 (significant), compared with 5.9% and 3.3% of patients with moderate and severe disease, respectively.

The most frequent reasons cited for decreased QoL were social discomfort/aesthetic issues (33.5%) and itching/skin discomfort (28.9%; Figure 4). The frequency of reasons cited as negatively influencing QoL did not vary greatly when the patients were stratified by disease severity; however, a greater number of patients with severe CSU than those with moderate or mild disease reported stress/anxiety/irritation/insomnia (12.5% vs 5.9% and 0.8%) and negative impact on working life (7.1% vs 0.9% and 0.8%) as influencing their QoL.

#### Choice of physician

One third of patients (35.2%) had seen other physicians prior to their current one. On average patients had previously changed at least two specialists. The most frequent

BMJ Open: first published as 10.1136/bmjopen-2016-012378 on 14 October 2016. Downloaded from http://bmjopen.bmj.com/ on June 14, 2025 at Agence Bibliographique de Enseignement Superieur (ABES)

Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies

reason for changing physicians was "dissatisfaction with the medical staff of the previous facility" (23.3%), followed by "the current center/physician is closer to where I live" (20.6%), "previous physicians were not able to find the right therapy" (19.6%), "previous physicians took too long to diagnose my disease" (18.0%), "innovative therapies that I couldn't access before are available in the new center" (14.8%), and "other" (3.7%).

The number of specialists that the patient changed in the past did not vary significantly when the sample was stratified by disease severity.

Provision of support services and patient information channels

Less than 5% of respondents indicated that the medical center that they attended provided patient support services. When support services were provided, these included support for families, psychological support and use of specific lotions.

Hard copy disease-related material (e.g., brochures about CSU) was distributed to 34.6% of respondents when they attended their care facility. The types of brochures provided included information/advice about: diet and lifestyle (65.1%); pathology evolution and symptoms (50.5%); general CSU information (45.7%); therapies (38.7%); patient diaries (21.0%); and modes of administration (19.9%).

When asked about the communication channels they used to access updates or information about their disease, 67.7% of patients responded that they had obtained information from internet sources at least once, including CSU-related websites, general internet searches, and online forums, while 41.3% asked a dermatologist. The types of channels through which patients received their information are summarized in Table 2.

#### **BMJ Open**

**Table 2.** Sources of disease information accessed by the patients with chronic

 spontaneous urticaria (CSU) who responded to the survey.

Source of information, n (% of patients)	Patient survey respondents (N=537)

## DISCUSSION

Based on the survey results, the specialists who treat CSU throughout Italy are managing a median 40 patients (IQR 20–80) each year. About half of CSU patients seen by allergy and dermatology specialists have mild CSU whereas the other half have severe disease. However, due to high proportion of specialists of both groups who were not familiar with the UAS and UAS7 scales, the classification of disease severity may not have been sufficiently objective. The importance of this clinical tool has to be stressed both for initial disease severity grading and for monitoring treatment efficacy.

A third of patients are referred to a CSU specialist by a general practitioner, and a fifth by emergency department staff or self-referral at symptom onset. Notably, more dermatologists than allergy specialists established the diagnosis of CSU. This may simply reflect the fact that, in Italy, dermatology specialists outnumber allergy specialists by three to one, therefore dermatologists are more accessible to patients than allergy specialists. General practitioners were only involved in the diagnosis of 10% of patients with CSU, emphasizing the complexity of diagnosing the disease and the need

BMJ Open: first published as 10.1136/bmjopen-2016-012378 on 14 October 2016. Downloaded from http://bmjopen.bmj.com/ on June 14, 2025 at Agence Bibliographique de Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

of referral to a specialist to establish a diagnosis. Overall, diagnosis was established an average of 7 months (median of 4 months, IQR 2–10.5) after the appearance of the first symptoms, although time to diagnosis was increased with disease severity (up to 13 months), possibly because a more accurate medical history has to be collected from each patient. Highlighting the complexity of the disease itself, 40% of specialists surveyed felt that CSU diagnosis was complex and the difficulty in identifying the cause of the pathology and the multiplicity of tests available for diagnosis were listed as factors contributing to the level of complexity in disease diagnosis. On the other hand the international guidelines strongly recommend only very limited routine diagnostic evaluations in CSU, in order to reduce the number of diagnostic tests.[1]

For most of the allergy and dermatology specialists, the ideal sequence of treatment, at the time of the survey, would be a standard and an increased dose of a non-sedating antihistamine as first-line and second-line treatment, respectively. For third-line treatment for non-responders, specialists tended to favor treatment with an increased dose non-sedating antihistamine in combination with a LTRA and an H<sub>2</sub>-antihistamine, or an increased dose non-sedating antihistamine in combination with a LTRA and an H<sub>2</sub>-antihistamine, or an increased dose non-sedating antihistamine in combination with a steroid or cyclosporine, a regimen especially preferred in more severe disease. Nevertheless, regardless of treatment regimen, over a quarter of all patients with CSU were refractory to the therapy they were receiving, and even complex/aggressive treatment regimens failed to resolve symptoms in almost half of the patients with severe disease. It should be noted that, at the time of the survey, a new therapeutic option was not yet authorized for CSU treatment. However, since then the approach to patients with refractory CSU has changed: the current EAACI/GA<sub>2</sub>LEN/EDF/WAO guidelines describe omalizumab as a 3<sup>rd</sup> line treatment for urticaria and the Italian regulatory authorities recommend to use omalizumab when patients do not respond to standard dosage of non-sedating

antihistamine.[1]

Moreover, data suggest that continuous therapy is associated to improved outcomes in terms of QoL.[5] However, this is not always reflected in real-life: a survey in patients with CSU in Germany and France showed that 78% of patients were taking medication for their CSU, but only 33% of these were taking it regularly for symptom prevention.[10]

For the specialists surveyed, the main goal of CSU treatment was key symptom resolution (itching and hives) and few considered improving QoL a priority. Importantly, the updated EAACI/GA<sub>2</sub>LEN/EDF/WAO guidelines strongly recommend complete symptom control, as safely as possible, to be the goal of treatment.[1] Appropriate management of CSU requires evidence-based guidance; however, only half of the specialists surveyed (more allergy specialists than dermatologists) knew of and used any of the CSU guidelines available, with allergy specialists twice as likely as dermatologists to use guidelines. Similarly, there was a gap in the knowledge of the specialists regarding the main scales used to assess disease activity, with only approximately half of the surveyed specialists acknowledging familiarity with the UAS and UAS7, and only one-sixth acknowledging familiarity with and utilized the CU-QoL questionnaire. The 2014 EAACI/GA<sub>2</sub>LEN/EDF/WAO guidelines provide a strong recommendation that disease activity should be assessed in clinical care using the UAS7, and that the CU-QoL is one of the validated instruments for assessing QoL impairment and for monitoring disease activity.[1]

Among patients surveyed across Italy, the prevalence of CSU has been found to be about the same in women and in men, unlike reports from other countries [3, 11]. Similar to patients with CSU in other countries, [12] about two-thirds of patients

BMJ Open: first published as 10.1136/bmjopen-2016-012378 on 14 October 2016. Downloaded from http://bmjopen.bmj.com/ on June 14, 2025 at Agence Bibliographique de l Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

reported that CSU had a negative impact on their QoL, affecting both their personal and professional life, and the frequency and level of impact increased with disease severity. More patients with severe disease than those with moderate of mild disease cited stress/anxiety/irritation/insomnia and negative impact on working life as impacting QoL.

In their efforts to obtain symptom relief, over a third of patients had on average consulted two previous physicians. Surprisingly, the number of specialists changed did not vary significantly when stratified by disease severity. The most common reason for switching providers was dissatisfaction with medical staff. Attending multiple medical centers due to dissatisfaction with treatment and reports of reduced quality of life are in accordance with existing literature in patients with CSU.[4, 6-8] A patient survey conducted in Germany and France also reiterated the impact CSU has on QoL and lack of satisfaction with physician care,[12] with patients indicating they were only "somewhat satisfied" with the care they were receiving. Satisfaction with treatment increased if the physician discussed the impact of CSU on emotions with their patient.

There appear to be a mismatch between patients with CSU and specialists as, while two third of the patients reported CSU affecting their QoL, only 8% of specialists considered improving QoL as a priority. Our results suggest that there is a need for specialists to routinely use the CU-QoL, in order to assess how patients are affected by the disease, and the UAS to monitor the disease and provide the most appropriate treatment. It is therefore important for specialists to focus their attention on the burden and the unmet needs of CSU and establishing more satisfying treatment schemes.

Furthermore, most patients (>95%) did not have patient support services available to them at their medical center.

#### **BMJ Open**

The limitations of the present study include those inherent in the survey/questionnaire format. Although the questionnaires were designed to minimize bias, there is always a subjective element remaining (e.g. respondents tend to avoid scoring at the end of scales and answer in a way they perceive to be desired by the investigator/be more socially acceptable).[13] A strength of the study is that, by selecting a representative sample of both patients with CSU and of specialists involved in the treatment of CSU in Italy, it provides a snapshot of the management of this condition from both perspectives, thereby highlighting current gaps in guideline-based care and unmet patient needs.

# CONCLUSIONS

In general, patients in Italy with CSU are similar to patients with CSU in other countries. However, there are some gaps in the care of these patients resulting in treatment dissatisfaction and a decreased QoL. These results should be used to improve the treatment of patients with CSU in Italy, in particular by reinforcing the knowledge of the available tools, such as the UAS and CU-QoL questionnaires, which can be used to assist specialists in treating patients with CSU. ## ACKNOWLEDGMENTS

#### Authorship

All named authors meet the International Committee of Medical Journal Editors (ICMJE) criteria for authorship for this manuscript, take responsibility for the integrity of the work as a whole, and have given final approval to the version to be published.

#### **Author contributions**

MR and NR were responsible for conception and design of the survey. MR was responsible for the acquisition of data; MR and NR had full access to the final data and performed the analysis. MR, NR and OR contributed to data interpretation, to the drafting and critical revision of the manuscript. All authors approved the final version and have final responsibility for content.

#### Medical writing, editorial, and other assistance

The authors would like to thank: all participants in this survey; Vincenza Vinaccia, Veronica Graus and Lorenzo Carraro of Novartis, Katia Massaroni, formerly of Novartis, and Nicola Negri, formerly of Stethos, for their constructive feedback and suggestions during preparation of the manuscript.

Medical writing assistance in drafting the outline and second draft for this manuscript as well as formatting for submission was provided by Sheridan Henness, PhD, and Cécile Duchesnes, PhD, of Springer Healthcare Communications, whilst the first draft was prepared by Nila Bhana, an independent medical writer, on behalf of Springer Healthcare Communications; this support was funded by Novartis Farma, Italy.

#### **BMJ Open**

Oliviero Rossi has been consultant and speaker for Meda, Novartis, MSD, Menarini in the last five years.

Marco Rimoldi is a partner of Stethos Srl and holds shares of this Company. Stethos Srl collaborates with Novartis Farma Italy on several market researches.

Nadia Rota is employee of Novartis Farma, Italy.

## **Funding statement**

Funding for the conduct of the survey, as well as for medical writing assistance and article processing charges, was provided by Novartis Farma, Italy.

## **Compliance with ethics guidelines**

The research was conducted in conformity with the Code of Conduct 2014 of the

European Pharmaceutical Market Research association (EphMRA).

## Data Sharing

No additional unpublished data are available

## ABSTRACT

**Objective:** To assess the clinical status of chronic spontaneous urticaria (CSU) and understand treatment approaches in Italy through both specialists who treat CSU (dermatologists and allergy specialists) and CSU patients' experience.

**Design:** Multicenter survey

Setting: Online structured questionnaires (one for physicians and one for patients)
Participants: Physicians and patients with CSU in Italy

Interventions: None

Primary/secondary outcomes: Physician and patient attitudes/experiences

**Results:** Survey results from 160 allergy and 160 dermatology specialists show that specialists see a median of 40 (interquartile range [IQR] 20–80) patients with CSU/year. While most specialists (56%) know the CSU guidelines, only 27% use them regularly (36% of allergy specialists vs 18% of dermatologists). This is reflected in treatment choices with differences between physicians who use guidelines regularly and those who do not: 91.6% versus 71.7% choose standard-dose, non-sedating antihistamines (nsAH) as first-line treatment; 85.9% versus 56.0% select up-dosing for second-line; and 65.3% versus 37.2% add leukotriene receptor antagonists (LTRA) or H<sub>2</sub>- antihistamines as third-line treatment. The diaries from 1385 patients highlight that, regardless of treatment regimen, 29.4% of currently treated patients are refractory to therapy. Specialists aim to resolve symptoms and only 7.8% report improving quality of life (QoL) as a priority. Only 16.6% of specialists are familiar with and utilize the

Urticaria Activity Score while 46.9% do not know it. Overall, 537 patients with CSU were surveyed (median age 37 years, IQR 30–46; 44.3% male; median disease duration 5 years, IQR 3–20). Approximately 62% confirm that CSU negatively impacts their QoL. Patients also complain of difficulties in getting information and support: less than 5% of medical centers provide patient support services.

**Conclusions:** In Italy, the gap between guideline-based care and QoL-related needs in CSU patients affects treatment satisfaction. This information could be used to improve the management of CSU in Italy.

### Article summary

Strengths and limitations of this study

- A strength of the study is the representative sample of both specialists who treat CSU and patients with CSU in Italy, giving insight into the management of this condition from dermatologists' and allergy specialists' experience
- Both CSU specialists and patients are represented, with a maximum margin of error of ±5.3% (95% confidence interval [CI]) and a maximum margin of error of ±4.2% (95% CI), respectively
- The conclusions drawn from the clinicians' perspective are supported by the collection of data from 1385 patient diaries
- The methodology minimizes bias because the physician survey was conducted online, without the involvement of an interviewer; the physicians were

BMJ Open: first published as 10.1136/bmjopen-2016-012378 on 14 October 2016. Downloaded from http://bmjopen.bmj.com/ on June 14, 2025 at Agence Bibliographique de l Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

responsible for compiling the survey and the patient diaries autonomously.

 Limitations include those inherent to the survey/questionnaire format, such as subjective bias

# INTRODUCTION

Urticaria is a disease characterized by the spontaneous development of wheals (papules or plaques) that are associated with itching, a burning sensation and/or pain; in some cases they are also associated with angioedema. [1] Wheals typically resolve within several hours to a day with no residual appearance. Angioedema is also sudden in appearance, but the swelling of the subcutaneous (lower dermis and subcutis) or submucosal tissues is associated with pain rather than itching, and a slower resolution than that for wheals, generally up to 72 hours.[1]

Most cases of urticaria tend to be acute (<6 weeks); however, urticaria lasting for 6 weeks or more is considered chronic and is further classified as two subtypes, chronic spontaneous urticaria (CSU) and inducible urticaria. The cause of the spontaneous appearance of daily or episodic wheals in CSU, with or without angioedema, can be known or unknown,[1] and symptoms can last for more than 5 years.[2 3]

An estimated 0.5–1% of the population, including children and adults, may be affected by CSU.[2 4] CSU is associated with a large societal burden, an impact on patients' personal life, reduced work performance and direct and indirect healthcare costs.[5]

The care of patients with CSU is challenging due to inability to identify the underlying

cause, the unpredictable disease course, the high disease burden, and the often limited efficacy of approved therapies.[5] Furthermore, CSU can have a significant impact on the patient's quality of life (QoL), and patients with CSU often experience depression and anxiety related to the disease.[4 6-8] Failed attempts to treat long-term symptoms can often lead to frustration on the part of both the patient and the physician,[5] and patients with long-term unresolved symptoms often present to a number of physicians in varying specialties in an attempt to seek relief.[4]

Data regarding CSU in Italy are currently limited. This survey aimed to assess the clinical status of CSU in Italy from the perspective of specialists who treat CSU (dermatologists and allergy specialists) and patients who have the disease. Both the specialists' therapeutic approach and the patients' experiences were assessed, with a focus on potential barriers to diagnosis and treatment that patients with CSU in Italy may experience.

## METHODS

#### Study design

This multicenter Italian survey comprised two questionnaires, one for physicians and one for patients with CSU. Only data from patients and physicians who accepted to be interviewed were collected. The survey was designed by an independent market research company (Stethos Marketing Research, Milan, Italy) and was tested with pilot interviews to specialists. Survey results were also collected and analyzed by Stethos Marketing Research and stratified according to geographical area and hospital/center size. Due to the qualitative nature of these surveys, no inferential analyses were

## performed.

The research was conducted in conformity with the Code of Conduct 2014 of the European Pharmaceutical Market Research Association (EphMRA).

## **Physician survey**

Data were collected from a sample of physicians, specifically specialists in dermatology or allergy, to assess their diagnostic-therapeutic approach to CSU. Physicians and centers were selected from a proprietary database of Stethos Marketing Research. In order to obtain a good level of confidence, 320 physicians – 160 dermatologists and 160 allergy specialists – from across Italy who were directly involved in the diagnosis and treatment of CSU were enrolled.

Physicians were asked to complete a survey exploring their approach to the management of CSU and also provided completed patient diaries. The survey, consisting of 28 questions, some of them with sub-questions (for a total of 37), was conducted online using a Computer-Assisted Web Interviewing (C.A.W.I.) platform with self-administered structured questions in Italian. The questions explored topics such as characteristics and records of patients with CSU seen in the clinical practice, patient management, treatments used, drivers for therapy, perceived goals, main drawbacks of therapy and the level of knowledge of existing guidelines (blank physician questionnaire forms, both in Italian and translated into English, are provided as Supplementary files 1 and 2, respectively). The specialists completed online Web Patient Diaries for the last five CSU patients examined during the study reference period. The objective was to collect at least 1000 patient diaries to allow for a robust

dataset including information about the diagnosis, the previous and current treatments and the frequency of visits (blank patient diaries forms, both in Italian and translated into English, are provided as Supplementary files 3 and 4, respectively). This sample of interviewees was to be representative of the population of the CSU specialists in Italy, with a maximum margin of error of  $\pm 5.3$  and a 95% confidence interval (CI).

#### **Patient survey**

The patient sample was targeted to ensure a good distribution by geographical area and size of the treating hospital. This was achieved by ranking the centers by the number of CSU patients being treated: the centers with the highest number of patients were selected. A random sample of patients with CSU being treated in each of these centers was asked to participate in the survey, before/after a routine assessment at the dermatology/allergy department. Planned enrolment was about 500 patients with CSU (an average of 4–5 patients from each center). This sample of respondents to the patient survey was to be representative of the population of patients with CSU in Italy (0.5–1% of the Italian population), with a maximum margin of error of  $\pm$ 4.2 and a 95% CI.

The patient surveys were self-administered via a C.A.W.I. system platform, and comprised of 46 questions, some of them with sub-questions (for a total of 50), including those where the respondents could provide demographic details, disease characteristics and disease history, rate their QoL and their treatment satisfaction. To investigate the journey of a patient with CSU arriving at a dermatology/allergy hospital center, the survey questions aimed to identify the steps followed and the possible barriers encountered during the diagnostic and therapeutic pathway, and to assess the impact of the condition on the patients' QoL (blank patient questionnaire forms, both in

Italian and translated into English, are provided as Supplementary files 5 and 6, respectively).

# RESULTS

# Specialist perspective

Demographic distribution of specialists

In total, 320 physicians (160 allergy and 160 dermatology specialists) from 194 centers in Northern (35.1%), Central (26.8%) and Southern (38.1%) Italy participated in the survey, and collected 1385 online patient diaries. The data were collected from January 29, 2014 to April 7, 2014. The distribution of allergy and dermatology specialists working in hospital practice (18.8% vs 16.9%), both hospital and private practice (49.4% vs 40.0%), or private practice only (31.9% vs 43.1%), was similar between groups.

Patients managed by the specialists

The allergy and dermatology specialists reported managing a median of 40 (IQR 20–80) patients with CSU annually, among whom the incidence of angioedema was 35.9%. Almost half of the patients treated by these specialists were considered to have severe disease (n=681; 49.2%) while the remaining patients were considered to have mild CSU (n=704; 50.8%), as assessed by the evaluation of the 1385 patient diaries. The distribution of patients in relation to disease severity did not change when the patient data from allergy and dermatology specialists (n=662 and n=723, respectively) were assessed separately. The number and frequency of the patients symptoms were

considered the key parameters for determining disease severity by both specialist groups, while the impact of CSU on patients QoL, the efficacy of the therapy and the comorbidities were deemed relevant by fewer specialists.

Among all the patients managed by the surveyed specialists, 39.3% had symptoms that appeared frequently and regularly; more patients with severe disease reported frequent and regular symptoms (49.0%). The majority of patients (71.7%) had frequent symptoms, with or without regularity. In patients with mild disease the symptoms tended to manifest in an unpredictable manner (Figure 1).

Patient referral and disease diagnosis

Data from the patient diaries showed that patients were commonly referred to a CSU specialist by a general practitioner (32.6%), after visitation to the emergency department (21.2%), or, in 20.9% of patients, they sought a specialist themselves when symptoms appeared. Some patients were referred to the allergy and dermatology specialists by other specialists, including dermatologists (11.0%), allergy specialists (6.0%), or other specialists (2.2%). It was unknown how the remaining patients (6.2%) were referred to the specialist. The first symptoms reported by patients to specialists were hives (47.9%), itching (47.7%), urticaria (37.5%), and angioedema (24.8%). The latter was most frequently reported by severe patients (33.2%) compared with mild patients (15.9%). The diagnosis of CSU was established by a dermatologist in 67.3% of cases (either the surveyed [46.0%] or previous [21.3%] dermatologist) and an allergy specialist). General practitioners (10.0%) or other specialists (0.4%) were involved markedly less frequently in diagnosing CSU. Among the 320 specialists surveyed, the diagnosis of CSU was

established an average of 7 months (median of 4 months, IQR 2–10.5) after the onset of the first symptoms in patients.

Specialists' knowledge of treatment guidelines

Among the 320 specialists surveyed, 56% were familiar with and used CSU guidelines, however, only 27% used them regularly. Compared with dermatologists, allergy specialists were twice as likely to regularly use guidelines (36% vs 18%) and more of them knew of the CSU guidelines (73% vs 45%; Figure 2a). A total of 189 specialists confirmed that they knew CSU guidelines; the guidelines that were most frequently mentioned as known (the relevant survey question was open-ended) were those by the European Academy of Allergy and Clinical Immunology

(EAACI/GA<sub>2</sub>LEN/EDF/WAO; 43.4%)[9] and Associazione Allergologi Immunologi Territoriali e Ospedalieri (AAITO; 21.7%).[10] The less-frequently known and used guidelines included those by Società Italiana di Dermatologia medica, chirurgica, estetica e delle Malattie Sessualmente Trasmesse (SIDeMaST; 4.2%[11]), British Society for Allergy and Clinical Immunology (BSACI; 2.6%[12]), and others (Figure 2b).

Symptomatic treatment of chronic spontaneous urticaria

When queried about the "ideal sequence" of symptomatic treatment for a patient with CSU (reflecting the approved indications at the time of the survey, in 2014), the majority (77.2%) of all specialists surveyed indicated that a standard dose of a non-sedating antihistamine (nsAH) was ideal as first-line treatment, while an increased-dose (<4 times the standard dose) nsAH was selected by 64.4% of specialists for second-line

treatment. While 45.1% of specialists chose an increased-dose nsAH in combination with a leukotriene antagonist (LTRA)/H<sub>2</sub>-antihistamine as third-line treatment, 36.1% indicated an increased-dose nsAH in combination with steroids would be an ideal third-line treatment; 30.9% of physicians indicated that they would reserve the latter as fourth-line treatment. 54.9% chose an increased-dose nsAH in combination with cyclosporine as a preferred fifth- or sixth-line treatment.

Notably, knowledge and use of the CSU guidelines was reflected in treatment choices, with differences between physicians who use guidelines regularly and those who do not: 91.6% versus 71.7%, respectively, choose standard-dose nsAH as first-line treatment; 85.9% versus 56.0% select increased-dose nsAH for second-line; and 65.3% versus 37.2% add leukotriene receptor antagonists (LTRA) or H<sub>2</sub>-antihistamines to increased-dose nsAH for third-line treatment. The combination of increased-dose nsAH and steroids was considered for third-line treatment by 26.0% versus 39.5% of physicians, respectively, and for fourth-line by 50.7% versus 24.2%; increased-dose nsAH in combination with cyclosporine was preferred for fifth-line by 62.0% versus 52.2% of specialists.

For the 1157 (83.5%) patients with CSU seen by the allergy and dermatology specialists who were receiving treatment at the time of the survey, the majority received a standard dose non-sedating  $H_1$ -antihistamine or increased-dose non-sedating  $H_1$ -antihistamine (Figure 3a). Fewer patients were receiving an increased-dose non-sedating antihistamine either in combination with steroids, cyclosporine,  $H_2$ -antihistamine, LTRA/ $H_2$ -antihistamine or LTRA (Figure 3a).

Comparing patients who had mild and severe disease, increased disease severity was

BMJ Open: first published as 10.1136/bmjopen-2016-012378 on 14 October 2016. Downloaded from http://bmjopen.bmj.com/ on June 14, 2025 at Agence Bibliographique de I Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

associated with more complex treatment regimens, predominantly increased-dose nonsedating antihistamine in combination with steroids or cyclosporine. While standarddose non-sedating antihistamines were used as treatment for patients with mild disease, markedly fewer patients with severe disease received this treatment (Figure 3b).

# Refractory chronic spontaneous urticaria

Regardless of the type of treatment received, 29.4% of all the patients with CSU currently treated were refractory to their therapy when the survey was conducted. Examining unresponsiveness for each current treatment showed that increased treatment was associated with increasing rates of unresponsiveness/disease severity (Figure 4).

## Treatment goals

For the specialists surveyed, the main goal of treatment was to reduce the symptoms of CSU, in particular itching (87.8%) and hives (46.2%). Only 7.8% of physicians reported improving QoL as a priority, although 15.0% did consider this a second priority. Generally there were no significant differences between allergy and dermatology specialists for treatment goals, except for a greater tendency of allergy specialists to report improvement of QoL as a second treatment goal (15.0%) compared with dermatologists (10.0%).

## Disease activity assessment

Of all the specialists, 46.9% did not know the Urticaria Activity Score (UAS). Although 36.6% knew of the scale, only 16.6% were familiar with and utilized the scale. Furthermore, 51.6% of the specialists did not know the UAS 7 days (UAS7), which uses

the sum of the daily UAS scores to supply a weekly UAS value, and only 6.6% used it. Finally, only 16.9% of the specialists surveyed were familiar with and utilized the Chronic Urticaria Quality of Life Questionnaire (CU-QoL).

There were no significant differences between the allergy and dermatology specialists in the familiarity and utilization of the UAS/UAS7 scales; the proportion of specialists who were unfamiliar with the UAS (41.9% and 51.9%, respectively) and UAS7 (48.1% and 55.0%, respectively) scales was high in both groups.

Complexity of disease diagnosis

When all the specialists were asked to rate the level of complexity in diagnosing CSU on a scale of 1 to 10 (1 = not at all complex; 10 = extremely complex), 40% considered that there was a high level of complexity ( $\geq$ 8) in diagnosing CSU. When the 210 specialists who rated the level of complexity as >5 were queried about the elements that increase the complexity of diagnosing CSU, over half (55.2%) chose 'several tests to diagnose CSU', while 44.3% responded that it was due to 'the great difficulty in identifying the cause of the pathology'; there were no significant differences in the responses to this questions between the allergy and dermatology specialists.

BMJ Open: first published as 10.1136/bmjopen-2016-012378 on 14 October 2016. Downloaded from http://bmjopen.bmj.com/ on June 14, 2025 at Agence Bibliographique de Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

A quarter of all specialists surveyed (n = 83) revealed that they consult with another specialist, and there is generally a high level of collaboration between allergy and dermatology specialists. In 95.3% of cases, the dermatologists requesting a colleague's opinion will turn to an allergy specialist, whereas 62.5% of allergy specialists will request a dermatologist's opinion and 70.0% the opinion of another allergy specialist.

# **Patient perspective**

Demographic and disease characteristics

In total, 537 patient surveys were conducted between May 6, 2014 to June 12, 2014.

The patients who responded to the survey (55.7% female) had a mean age of 39 years

(median 37 years, IQR 30-46). Mean and median ages were similar between men (mean

39 years; median 38, IQR 31-46) and women (mean 39; median 37 years, IQR 29-46).

Almost 84% of respondents were aged 50 years or under (Table 1).

 Table 1. Baseline demographic characteristics of patients with chronic spontaneous

 urticarial (CSU).

Characteristic or demographic	Patient survey respondents (N=537)
Gender, n (% patients)	
Female	299 (55.7)
Male	238 (44.3)
Age group, n (% patients)	
$\leq 30$ years	139 (25.9)
31–40 years	175 (32.6)
41–50 years	135 (25.1)
51–60 years	66 (12.3)
>60 years	22 (4.1)
Geographical region, n (% patients)	
North-West	141 (26.3)
North-East	61 (11.4)
Centre	106 (19.7)
South	229 (42.6)
Disease severity, n (% patients)	Ň Ý
Mild	120 (22.3)
Moderate	323 (60.1)
Severe	56 (10.4)

At the time of the survey, patients had an average disease duration of 13 years (median

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

5 years, IQR 3–20) and 45.6% of patients had lived with the disease for 2–5 years (Table 1). The majority of patients surveyed had moderate disease (Table 1). Impact of chronic spontaneous urticaria on quality of life

Almost two-thirds (61.6%) of patient respondents indicated that their CSU had a negative impact on their QoL, with a rating of 4–6 (1 = no impact on QoL; 6 = significant impact on QoL), while only 4.3% reported the CSU had no influence on their QoL. The frequency of patients rating the impact of CSU on their QoL as  $\geq$ 4 to 6 varied with disease severity, from a minimum of 35.8% of patients with mild disease to 70.0% and 80.4% of patients with moderate and severe disease, respectively. One third (33.9%) of patients with severe CSU rated the level of disease influence on their QoL as 6 (significant), compared with 5.9% and 3.3% of patients with moderate and severe disease, respectively.

The most frequent reasons cited for decreased QoL were social discomfort/aesthetic issues (33.5%) and itching/skin discomfort (28.9%; Figure 5). The frequency of reasons cited as negatively influencing QoL did not vary greatly when the patients were stratified by disease severity; however, a greater number of patients with severe CSU than those with moderate or mild disease reported stress/anxiety/irritation/insomnia (12.5% vs 5.9% and 0.8%) and negative impact on working life (7.1% vs 0.9% and 0.8%) as influencing their QoL.

# Choice of physician

One third of patients (35.2%) had seen other physicians prior to their current one. On average patients had previously changed at least two specialists. The most frequent

BMJ Open: first published as 10.1136/bmjopen-2016-012378 on 14 October 2016. Downloaded from http://bmjopen.bmj.com/ on June 14, 2025 at Agence Bibliographique de Enseignement Superieur (ABES)

Enseignement Superieur (ABES). Protected by copyright, including for uses related to text and data mining, AI training, and similar technologies

reason for changing physicians was "dissatisfaction with the medical staff of the previous facility" (23.3%), followed by "the current center/physician is closer to where I live" (20.6%), "previous physicians were not able to find the right therapy" (19.6%), "previous physicians took too long to diagnose my disease" (18.0%), "innovative therapies that I couldn't access before are available in the new center" (14.8%), and "other" (3.7%). The number of specialists that the patient changed in the past did not vary significantly when the sample was stratified by disease severity.

Provision of support services and patient information channels

Less than 5% of respondents indicated that the medical center that they attended provided patient support services. When support services were provided, these included support for families, psychological support and use of specific lotions.

Hard copy disease-related material (e.g., brochures about CSU) was distributed to 34.6% of respondents when they attended their care facility. The types of brochures provided included information/advice about: diet and lifestyle (65.1%), pathology evolution and symptoms (50.5%), general CSU information (45.7%), therapies (38.7%), patient diaries (21.0%), and modes of administration (19.9%).

When asked about the communication channels they used to access updates or information about their disease, 67.7% of patients responded that they had obtained information from internet sources at least once, including CSU-related websites, general internet searches, and online forums, while 41.3% asked a dermatologist. The types of channels through which patients received their information are summarized in Table 2.

#### **BMJ Open**

None	60 (11.2)

# DISCUSSION

Based on the survey results, the specialists who treat CSU throughout Italy are managing a median 40 patients with CSU each year. About half of CSU patients seen by allergy and dermatology specialists have mild CSU whereas the other half have severe disease. However, due to high proportion of specialists of both groups who were not familiar with the UAS and UAS7 scales, the classification of disease severity may not have been sufficiently objective. The limited use of such scales was probably due to the fact that the 2009 EAACI/GA<sub>2</sub>LEN/EDF/WAO urticaria guidelines (the current version at the time the survey was conducted) didn't mention them [9]. The importance of this clinical tool has to be stressed both for initial disease severity grading and for monitoring treatment efficacy.

A third of patients are referred to a CSU specialist by a general practitioner, and a fifth by emergency department staff or self-referral at symptom onset. Notably, more dermatologists than allergy specialists established the diagnosis of CSU. This may

BMJ Open: first published as 10.1136/bmjopen-2016-012378 on 14 October 2016. Downloaded from http://bmjopen.bmj.com/ on June 14, 2025 at Agence Bibliographique de Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

simply reflect the fact that, in Italy, dermatology specialists outnumber allergy specialists by three to one, therefore dermatologists are more accessible to patients than allergy specialists. General practitioners were only involved in the diagnosis of 10% of patients with CSU, emphasizing the complexity of diagnosing the disease and the need of referral to a specialist to establish a diagnosis. Overall, diagnosis was established on average 7 months after the appearance of the first symptoms, although time to diagnosis was increased with disease severity, possibly because a more accurate medical history has to be collected from each patient. Highlighting the complexity of the disease itself, 40% of specialists surveyed felt that CSU diagnosis was complex and the difficulty in identifying the cause of the pathology and the multiplicity of tests available for diagnosis. On the other hand the international guidelines strongly recommend only very limited routine diagnostic evaluations in CSU, in order to reduce the number of diagnostic tests.[1]

For most of the allergy and dermatology specialists, the ideal sequence of treatment, at the time of the survey, would be a standard and an increased dose of a non-sedating antihistamine as first-line and second-line treatment, respectively. For third-line treatment for non-responders, specialists tended to favor treatment with an increased dose non-sedating antihistamine in combination with a LTRA and an H<sub>2</sub>-antihistamine, or an increased dose non-sedating antihistamine in combination with a steroid or cyclosporine, a regimen especially preferred in more severe disease. Nevertheless, regardless of treatment regimen, over a quarter of all patients with CSU were refractory to the therapy they were receiving, and even complex/aggressive treatment regimens

failed to resolve symptoms in almost half of the patients with severe disease. It should be noted that, at the time of the survey, a new therapeutic option was not yet authorized for CSU treatment. However, since then the approach to patients with refractory CSU has changed: the current EAACI/GA<sub>2</sub>LEN/EDF/WAO guidelines describe omalizumab as a third-line treatment for urticaria and the Italian regulatory authorities recommend to use omalizumab when patients do not respond to a standard dosage of non-sedating antihistamine.[1]

Moreover, data suggest that continuous therapy is associated to improved outcomes in terms of QoL.[5] However, this is not always reflected in real-life: a survey in patients with CSU in Germany and France showed that 78% of patients were taking medication for their CSU, but only 33% of these were taking it regularly for symptom prevention.[13]

For the specialists surveyed, the main goal of CSU treatment was key symptom resolution (itching and hives) and few considered improving QoL a priority. Importantly, the updated EAACI/GA<sub>2</sub>LEN/EDF/WAO guidelines strongly recommend complete symptom control, as safely as possible, to be the goal of treatment.[1] In a similar way, the 2009 EAACI/GA<sub>2</sub>LEN/EDF/WAO guidelines recommended that the aim of treatment was to achieve complete symptom relief [9]. Appropriate management of CSU requires evidence-based guidance; however, only half of the specialists surveyed (more allergy specialists than dermatologists) knew of and used any of the CSU guidelines available, with allergy specialists twice as likely as dermatologists to use guidelines. Notably, the level of knowledge and use of the guidelines correlated with the treatment choices, and therapies selected by physicians not using guidelines

#### **BMJ Open**

Similarly, there was a gap in the knowledge of the specialists regarding the main scales used to assess disease activity, with only approximately half of the surveyed specialists acknowledging familiarity with the UAS and UAS7, and only one-sixth acknowledging familiarity with and utilized the CU-QoL questionnaire. The 2014

EAACI/GA<sub>2</sub>LEN/EDF/WAO guidelines provide a strong recommendation that disease activity should be assessed in clinical care using the UAS7, and that the CU-QoL is one of the validated instruments for assessing QoL impairment and for monitoring disease activity [1]. In the 2009 EAACI/GA<sub>2</sub>LEN/EDF/WAO guidelines the UAS and UAS7 were not mentioned but the CU-QoL, that had been generated and tested in the Italian language [14] and had only recently been validated in other languages, was recognized as a suitable instrument for the assessment of the health burden both of CSU and its treatment [9].

Among patients surveyed across Italy, the prevalence of CSU has been found to be about the same in women and in men, unlike reports from other countries [3, 15]. Similar to patients with CSU in other countries,[16] about two-thirds of patients reported that CSU had a negative impact on their QoL, affecting both their personal and professional life, and the frequency and level of impact increased with disease severity. More patients with severe disease than those with moderate of mild disease cited stress/anxiety/irritation/insomnia and negative impact on working life as impacting QoL.

In their efforts to obtain symptom relief, over a third of patients had on average consulted two previous physicians. Surprisingly, the number of specialists changed did

#### **BMJ Open**

not vary significantly when stratified by disease severity. The most common reason for switching providers was dissatisfaction with medical staff. Attending multiple medical centers due to dissatisfaction with treatment and reports of reduced quality of life are in accordance with existing literature in patients with CSU.[4 6-8] A patient survey conducted in Germany and France also reiterated the impact CSU has on QoL and lack of satisfaction with physician care,[16] with patients indicating they were only "somewhat satisfied" with the care they were receiving. Satisfaction with treatment increased if the physician discussed the impact of CSU on emotions with their patient.

There appear to be a mismatch between patients with CSU and specialists as, while two third of the patients reported CSU affecting their QoL, only 8% of specialists considered improving QoL as a priority. Our results suggest that there is a need for specialists to routinely use the CU-QoL, in order to assess how patients are affected by the disease, and the UAS to monitor the disease and provide the most appropriate treatment. It is therefore important for specialists to focus their attention on the burden and the unmet needs of CSU and establishing more satisfying treatment schemes. BMJ Open: first published as 10.1136/bmjopen-2016-012378 on 14 October 2016. Downloaded from http://bmjopen.bmj.com/ on June 14, 2025 at Agence Bibliographique de Enseignement Superieur (ABES)

Protected by copyright, including for uses related to text and data mining, AI training, and similar technologies

Furthermore, most patients did not have patient support services available to them at their medical center.

The limitations of the present study include those inherent in the survey/questionnaire format. Although the questionnaires were designed to minimize bias, there is always a subjective element remaining (e.g. respondents tend to avoid scoring at the end of scales and answer in a way they perceive to be desired by the investigator/be more socially acceptable).[17] A strength of the study is that, by selecting a representative sample of both patients with CSU and of specialists involved in the treatment of CSU in Italy, it

BMJ Open: first published as 10.1136/bmjopen-2016-012378 on 14 October 2016. Downloaded from http://bmjopen.bmj.com/ on June 14, 2025 at Agence Bibliographique de Enseignement Superieur (ABES) . Protected by copyright, including for uses related to text and data mining, Al training, and similar technologies.

provides a snapshot of the management of this condition from both perspectives, thereby highlighting current gaps in guideline-based care and unmet patient needs.

# CONCLUSIONS

In general, patients in Italy with CSU are similar to patients with CSU in other countries. However, there are some gaps in the care of these patients resulting in treatment dissatisfaction and a decreased QoL. These results should be used to improve the treatment of patients with CSU in Italy, in particular by reinforcing the knowledge of the available tools, such as the UAS and CU-QoL questionnaires, which can be used to assist specialists in treating patients with CSU. 

## Authorship

All named authors meet the International Committee of Medical Journal Editors (ICMJE) criteria for authorship for this manuscript, take responsibility for the integrity of the work as a whole, and have given final approval to the version to be published.

# Author contributions

MR and NR were responsible for conception and design of the survey. MR was responsible for the acquisition of data; MR and NR had full access to the final data and performed the analysis. MR, NR and OR contributed to data interpretation, to the drafting and critical revision of the manuscript. All authors approved the final version and have final responsibility for content.

# Medical writing, editorial, and other assistance

The authors would like to thank: all participants in this survey; Vincenza Vinaccia, Veronica Graus and Lorenzo Carraro of Novartis, Katia Massaroni, formerly of Novartis, and Nicola Negri, formerly of Stethos, for their constructive feedback and suggestions during preparation of the manuscript.

Medical writing assistance in drafting the outline and second draft for this manuscript as well as formatting for submission was provided by Sheridan Henness, PhD, and Cécile Duchesnes, PhD, of Springer Healthcare Communications, whilst the first draft was prepared by Nila Bhana, an independent medical writer, on behalf of Springer Healthcare Communications; this support was funded by Novartis Farma, Italy.

# **Competing interests**

Oliviero Rossi has been consultant and speaker for Meda, Novartis, MSD, Menarini in the last five years.

Marco Rimoldi is a partner of Stethos Srl and holds shares of this Company. Stethos Srl collaborates with Novartis Farma Italy on several market researches.

Nadia Rota is an employee of Novartis Farma, Italy.

# Data sharing statement

No additional data are available.

# Funding statement

Funding for the conduct of the survey, as well as for medical writing assistance and article processing charges, was provided by Novartis Farma, Italy.

# **Compliance with ethics guidelines**

The research was conducted in conformity with the Code of Conduct 2014 of the

European Pharmaceutical Market Research association (EphMRA).

59 60 Egregio Dottore, Gentile Dottoressa,

Stethos, istituto di ricerche di mercato specializzato nel campo farmaceutico, sta conducendo uno studio a livello nazionale sulla **Orticaria Spontanea Cronica**, coinvolgendo Medici Specialisti in Dermatologia e Medici Specialisti in Allergologia.

Lo studio non ha alcuna finalità promozionale né commerciale ed è volto ad analizzare ed approfondire come viene gestita oggi questa patologia e quali sono le motivazioni che guidano il clinico nella scelta di trattare farmacologicamente un paziente affetto da CSU. Se accetta di collaborare, le chiediamo cortesemente di compilare il questionario che segue rispondendo ad alcune domande relative alla sua personale esperienza ed opinione nei confronti dei questa patologia. Oltre al questionario, le chiediamo poi di compilare un brevissimo diario relativo agli ultimi 5 pazienti affetti da CSU che lei ha visitato.

L'impegno previsto è di circa 20 minuti.

# INFORMATIVA PRIVACY

Desideriamo rassicurarLa circa il fatto che:

- Agiremo nel rispetto di tutte le leggi sulla privacy (D.Lgs. 196/03) per la tutela dei dati personali e delle linee guida emanate da "Market Research Society/European Pharmaceutical Marketing Research Association/ESOMAR".

# **Casistica pazienti CSU**

Dom 1. Dottore, Lei si occupa <u>personalmente</u> della diagnosi e del trattamento di pazienti affetti da Orticaria Spontanea Cronica (CSU)?

- $\Box$  Sì  $\rightarrow$  proseguire con Dom.2
- $\square$  No  $\rightarrow$  chiudere, intervista non valida. Non in target.

Dom 2. Quanti sono complessivamente i pazienti affetti da CSU da Lei seguiti nel corso di un anno, compresa l'attività ambulatoriale? |\_\_|\_\_|

Dom 3. Di questi pazienti quanti presentano anche un angioedema? |\_\_|\_|

Dom 4. In media quante nuove diagnosi di CSU effettua in un anno? |\_\_|\_\_|

**Dom 5. Percentualmente quanti sono tra i Suoi pazienti affetti da CSU quelli che non ricevono alcun trattamento specifico per la CSU?** pazienti non trattati

Dom 6. Prendendo in considerazione i soli pazienti CSU <u>trattati</u> come si distribuiscono percentualmente in base al trattamento farmacologico?

• mal di testa

Dom 13.Ora dovrebbe assegnare un punteggio ai principali trattamenti farmacologici a disposizione dei clinici per il trattamento della CSU, per ognuna delle caratteristiche che ha appena valutato. Può assegnare un punteggio da 1 a 10, dove 1 indica una valutazione "decisamente negativa" e 10 indica, invece, una valutazione "decisamente positiva" della caratteristica rispetto al farmaco.

Stethos, a market research company specialising in the pharmaceutical sector, is conducting a nation-wide survey among Physician Specialists in Dermatology and Physician Specialists in Allergology on the subject of **Chronic Spontaneous Urticaria**,

The survey has no promotional or commercial purposes and aims to analyse in depth how this disease is managed and what motivations guide clinicians in their decision to commence a pharmacological therapy in affected patients. If you agree to take part, we would kindly ask you to complete the following questionnaire by answering some questions concerning your personal experience and your opinions about this disease. In addition to the questionnaire, we also ask you to complete a very short patient diary for each of the last 5 CSU patients you have assessed.

The expected time commitment is approximately 20 minutes.

# PRIVACY STATEMENT

Please be assured that:

- Our actions will comply with all the laws on privacy (Italian Law no. 196/03) for the protection of personal data and the guidelines issued by the "Market Research Society/European Pharmaceutical Marketing Research Association/ESOMAR".
   Your answers will be used exclusively for the purposes of market research.
- Your answers will be used exclusively for the purposes of market research.
- Your answers will be combined with those of other respondents and will be analysed in anonymous and pooled form.
  Your answers will be handled with maximum confidentiality and will not be used for any purpose other than those
- indicated, nor will they be disclosed to any third party without your consent.
- You have the right to terminate the interview at any time.

#### PHARMACOVIGILANCE-RELATED INFORMATION

We guarantee that any information supplied will be handled with maximum confidentiality and anonymity. Only in the case that you should describe an adverse event in a specific patient, we will ask you for permission to collect this information and forward it to our client (even if you have already reported the event in accordance with the Italian regulations in force). Therefore, in this case, you will be asked to waive your right to confidentiality in compliance with the rules expressed in the ESOMAR Code of Conduct. Any other information provided in the course of the interview shall be considered absolutely confidential.

## Q. 0 Are you willing to take part in the interview?

- $\Box$  YES  $\rightarrow$  continue
- $\square$  NO  $\rightarrow$  close

# **RESPONDENT'S PROFILE AND DETAILS OF CENTRE**

#### 1. NAME

- 2. SURNAME
- 3. HOSPITAL
- 4. Email address
- 5. Telephone number

# **CSU** caseload

Q. 1. Do you <u>personally</u> conduct the diagnosis and treatment of patients affected by Chronic Spontaneous Urticaria (CSU)?

- $\Box$  Yes  $\rightarrow$  go on to Q.2
  - $\hfill\square$  No  $\hfill \rightarrow$  close, interview not valid. Not in target population.

Q. 2. Overall, how many CSU patients do you care for in a year, including during your ambulatory activity?  $|\_|\_|\_|$ 

Q. 3. How many of these patients are also affected by angioedema? |\_\_|\_\_|

- Q. 4. On average, how many new cases of CSU do you diagnose in a year? |\_\_|\_\_|
- **Q. 5.** What percentage of your CSU patients receive no specific treatment for CSU? untreated patients |\_|\_| %

Q. 6. Taking into consideration your <u>treated</u> CSU patients only, how are they distributed with regard to their pharmacological treatment?

·S'	TETHOS S.	State of the art of CSU in Italy Quantitative Assessment	<i>DEF – 25/02/14</i> Stethos study code: 131187
	Rapidity of drug action		/10
	Duration of drug action		/10
	Efficacy of treatment		/10
	Way of administration		/10
	Frequency of administration		/10
	Drug safety		/10
	Impact of the treatment on the	patient's quality of life	/10
	Cost of the treatment		/10
	Patient monitoring required after	er beginning the treatment	/10

If Q.12 "impact of the treatment on the patient's quality of life" was rated  $\geq 6$ 

0.12.A What aspects/elements does the patient consider to be most critical, difficult to cope with and having the greatest impact on his/her life? Please indicate the first 3 aspects in order of importance.

1st	2nd	3rd
• itching		
• angioedema		
<ul> <li>unpredictability of symptoms</li> </ul>		
<ul> <li>impact of disease on physical appearance</li> </ul>	e	
depression		
• hives		

- impact of the disease on social relations
- headache

Now please rate the main pharmacological therapies available to clinicians for the Q. 13. treatment of CSU, from the point of view of the characteristics rated in Q.12. Rate them from 1 to 10, where 1 indicates a "definitely negative" rating and 10 indicates a "definitely positive" rating of the therapy in relation to the characteristic.

Characteristic	ANTIHISTAMINES	CYCLOSPORIN	ANTIHISTAMINES + STEROIDS	ANTIHIISTAMINES +LEUKOTRIENE ANTAGONISTS
Rapidity of action drug	/10	/10	/10	/10
Duration of action drug	/10	/10	/10	/10

Stethos è un istituto di ricerche di mercato specializzato nel campo farmaceutico. Attualmente stiamo conducendo uno studio a livello nazionale sull'Orticaria Spontanea Cronica, volto a rilevare l'approccio dei pazienti nei confronti della malattia ed eventuali bisogni ad oggi non ancora soddisfatti. Più nello specifico, l'obiettivo di questa ricerca consiste nel rilevare i bisogni e le opinioni dei pazienti affetti da questa patologia, al fine di coinvolgerlo in prima linea nello sviluppo di nuove attività e servizi a supporto della gestione della patologia di cui soffre e del trattamento seguito.

Si senta libero di esprimere i Suoi pensieri e le Sue opinioni rispetto ai temi che verranno trattati nel questionario. Stethos non rappresenta alcuna delle Aziende Farmaceutiche che verranno eventualmente nominate, per cui non dovrà avere alcuna remora nell'esprimere qualsiasi tipo di opinione o commento.

Precisiamo che nel rispetto della legge sulla privacy (D.lgs. 196/03 e successivi articoli), è libero/a di interrompere l'intervista o evitare di rispondere ad alcune domande qualora lo ritenesse opportuno. Garantiamo inoltre che qualsiasi informazione fornita verrà trattata in forma strettamente riservata ed anonima, senza l'uso di dati personali o altri recapiti.

Le risposte che verranno fornite nel corso di questa intervista saranno, ovviamente, tutelate dalla privacy; solo nel caso in cui dovesse fare riferimento a un evento avverso riscontrato durante o dopo la somministrazione di un farmaco, le chiederemo l'autorizzazione a segnalare il suo nominativo al reparto di farmacovigilanza della casa farmaceutica del farmaco in questione, anche nel caso in cui lei lo abbia già segnalato direttamente all'azienda o al suo medico.

Ogni altra cosa che verrà detta durante l'intervista continuerà a restare anonima e confidenziale.

Innanzitutto la ringrazio per aver accettato di collaborare a questo studio.

Dom. 1) Lei soffre di Orticaria Spontanea Cronica?

🗆 sì → proseguire con la compilazione del questionario 🗆 no  $\rightarrow$  la compilazione è terminata

### Dom. 2) Da guanto tempo soffre di Orticaria Spontanea Cronica? Nel rispondere consideri guando la prima volta si sono manifestati i sintomi dell'orticaria spontanea cronica di cui soffre. |\_\_| anni

Dom. 3) In quale anno le è stata diagnosticata la patologia? |\_\_|\_|\_| anno diagnosi

# Dom. 4) Che terapia segue attualmente per l'Orticaria Spontanea Cronica di cui Lei soffre?

- nessuna terapia
- □ solo antistaminico
- antistaminico in combinazione con antileucotrieni (es. Singulair, Montegen, Lukasm, Montelukast Tev)
- □ cortisone/corticosteroidi (da soli o in associazione ad altre terapie)
- □ omalizumab (Xolair)
- □ altro farmaco / altra associazione di farmaci

## Dom. 5) A chi si è rivolto la prima volta in cui le sono comparsi i primi sintomi di orticaria?

- □ pronto soccorso
- □ medico di base (MMG)
- □ l'attuale Dermatologo che mi ha in cura
- □ l'attuale Allergologo che mi ha in cura
- □ un altro Dermatologo diverso da quello da cui sono in cura oggi
- □ un altro Allergologo diverso da quello da cui sono in cura oggi
- altro specialista \_\_\_\_\_ quale

### Dom. 6) Dopo quanto tempo dalla comparsa dei primi sintomi si è recato al pronto soccorso o si è rivolto ad un medico, la prima volta?

- □ subito, appena ho visto i primi segni della malattia
- □ dopo qualche giorno
  - □ dopo qualche settimana
- 🗆 dopo 2-3 mesi
- □ dopo 4-6 mesi
  - □ dopo circa 1 anno
  - □ dopo circa 2-3 anni
  - □ dopo oltre 4 anni

Quantitative Questionnaire Extensive phase on patients affected by CSU

Draft5 – 23/04/2014 Stethos study code: 140320

# INTRODUCTION

## Hello!

Stethos is a market research institute specialising in the pharmaceutical sector. We are currently conducting a **nation-wide survey on Chronic Spontaneous Urticaria**, with the aim of understanding **patients' attitudes** to the disease and **any needs that remain unmet**. More specifically, the purpose of the survey is to identify the needs and opinions of patients affected by CSU, in order to involve them directly in the development of new activities and services to support disease's management and treatment.

Please feel free to express your thoughts and opinions with regard to the topics addressed in this questionnaire. Stethos does not represent any of the Pharmaceutical Companies that may be mentioned, so please have no qualms about expressing any type of opinion or comment.

Also note that in accordance with the Italian laws on privacy (Italian Law no. 196/03 and subsequent amendments), you are free to interrupt the interview whenever you want and to avoid to answer to some questions... Moreover, we guarantee that <u>any information you provide will be handled with strict confidentiality</u> and anonymity, without the use of personal data or other contact details.

The privacy of the answers provided in the course of this interview will clearly be safeguarded; only in the case that you should mention an adverse event encountered while or after drug administration, we will askfor your permission to give your name to the pharmacovigilance department of the pharmaceutical company producinnf the drug, even if you have already notified it to the company or to your doctor. The content of the rest of the interview will continue to remain anonymous and confidential.

Firstly, thank you for agreeing to collaborate in this survey.

### Q. 1. Do you suffer from Chronic Spontaneous Urticaria?

- $\Box$  yes  $\rightarrow$  continue with the questionnaire
- $\square$  **NO** $\rightarrow$  terminate the questionnaire
- Q. 2. How long have you been suffering from Chronic Spontaneous Urticaria? To answer, consider the first time in which the symptoms of your Chronic Spontaneous Urticaria appeared.
- Q. 3. When the diseasehas been diagnosed (year)? |\_\_|\_| year of diagnosis

## Q. 4. Which is your current therapy for your Chronic Spontaneous Urticaria?

no treatment

## □ only antihistamine

□ antihistamine in combination with leukotriene antagonist (e.g., Singulair, Montegen, Lukasm, Montelukast Tev)

- □ cortisone/steroids (alone or in combination with other therapies)
- □ omalizumab (Xolair)
- □ another medicine / combination of medicines

### Q. 5. Who did you seek help from when the symptoms of urticaria first appeared?

- emergency department
- $\Box$  my general practitioner (GP)
- $\hfill\square$  the Dermatologist who is currently treating me
- $\hfill\square$  the Allergologist who is currently treating me
- $\hfill\square$  another Dermatologist, different from my current one
- □ another Allergologist, different from my current one
- □ another specialist \_\_\_\_\_please specify \_

# Q. 6. How long after the appearance of the <u>first symptoms</u> did you go to the emergency department or a doctor for the first time?

- $\Box$  immediately, as soon as I saw the first signs of the disease
- □ a few days later
- a few weeks later
- after 2-3 months
- after 4-6 months
- 🗆 after about 1 year
- □ after about 2-3 years
- □ after more than 4 years
- $\hfill\square$  I don't remember when

Quantitative Question	onna	ire						
·STETH©S· Extensive phase on patients			by CS	υ		ft5 – 23 os study c		
Q. 35. Now we ask you to rate the following aspects, "definitely negative rating reflecting total dissati positive rating reflecting total satisfaction".	on a	sca	le fron	1 1 to	<b>5 10 v</b>	vhere	L indi	cates a
<ul> <li>Waiting times to book an appointment (test and/or consultation)</li> </ul>	□1	□2	□3 □4	□5	□6	□7 □8	8 □9	□10
• Waiting times between the booking and the appointment (test and/or consultation)	□1	□2	□3 □4	□5	□6	□7 □8	8 □9	□10
• Waiting times in relation to the time of the appointment (for a test and/or consultation)	□1	□2	□3 □4	□5	□6	□7 □8	8 □9	□10
<ul> <li>Waiting times for collection of reports</li> </ul>	□1	□2	□3 □4	□5	□6	□7 □8	3 □9	□10
Information received from the center's healthcare personnel	□1	□2	□3 □4	□5	□6	□7 □8	8 □9	□10
<ul> <li>General level of services of your treating center</li> </ul>	□1	□2	□3 □4	□5	□6	□7 □8	3 □9	□10
Convenient location/easy access to your treating center from your home	□1	□2	□3 □4	□5	□6	□7 □8	8 □9	□10
Number of doctors / nurses working in your treating clinic / center	□1	□2	□3 □4	□5	□6	□7 □8	3 □9	□10

Q. 36. In general, do you encounter or have you encountered any difficulties when, for example, you need to book tests or consultations? If so, could you please indicate what difficulties or issues you have encountered?

- Q. 37. How inconvenient do you find it to go to your treating center for periodic examinations or tests? To answer, take into consideration the journey between your home and the center, the time it takes to do the tests, the frequency with which you have to do them, etc. Please answer by giving a rating from 1 to 10 where 1 indicates "I don't find it at all inconvenient" and 10 indicates "I find it highly inconvenient".
  - □1 □2 □3 □4 **□5** □6 □7 □8 □9 □10
- Q. 38. Do you have any ideas or suggestions or can you think of any particular service that could be put in place by your treating center or a pharmaceutical company to make this aspect easier?

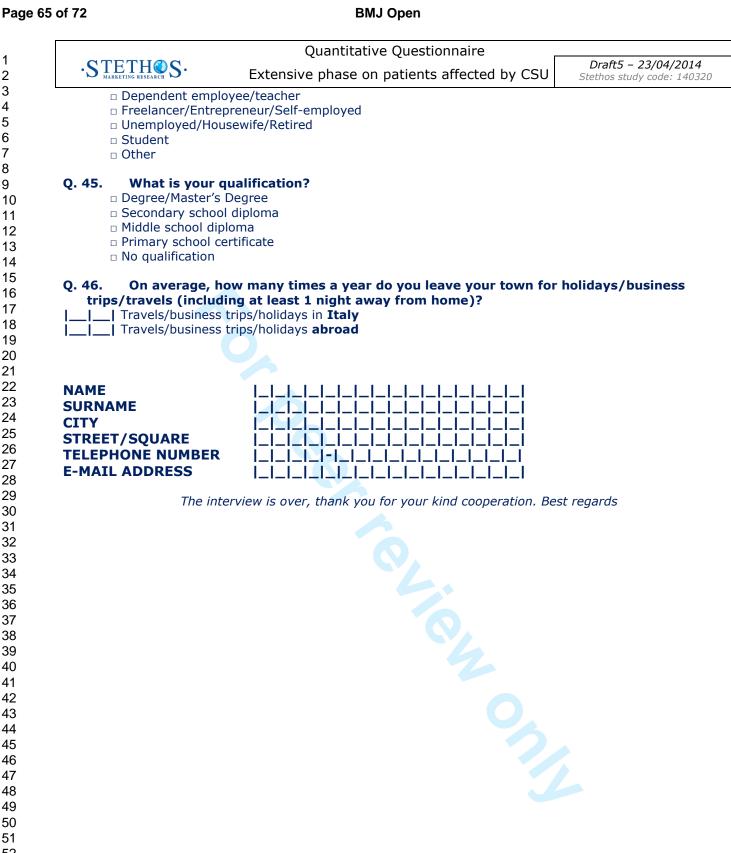

open \_

- Q. 39. If a special home-care service were available for patients affected by Chronic Spontaneous Urticaria - for example, to help you find the medicines required for treatment or provide support during injection of the medicine in the event that you require an injection therapy, how useful would you rate this service? Please answer by rating it from 1 to 10 where 1 indicates "absolutely useless" and 10 indicates "definitely useful". 1 2 3 4 5 6 7 8 9 10
- Q. 40. The very last question. Is there some service, activity, special aspect that you believe could be of help and support for a person who, like you, is affected by Chronic Spontaneous Urticaria? To answer, think of all the services and forms of support you have benefitted from or, on the contrary, to all the things you need now and aren't being given or would have needed in the past but were not given.

We have reached the end of the interview. Complete the grid below with your socio-demographic profile.

- Q. 41. You are ... a man a woman
- Q. 42. How old are you? |\_\_|
- Q. 43. What's the composition of your family?
  - I live alone
  - I live with my family of origin (parents)
  - I live with my partner without children
  - I live with my partner and have children
    - I live alone with my children

### Q. 44. What's your occupation?

	Item No	Recommendation
Title and abstract	1	(a) Indicate the study's design with a commonly used term in the title or the abstrac
		The title on page 1 in the main manuscript states the study design:
		"The state of the art of chronic spontaneous urticaria in Italy: a
		multicenter survey to evaluate physicians' and patients' perspective"
		(b) Provide in the abstract an informative and balanced summary of what was done
		and what was found
		Please see the abstract from page 2 to 3
Introduction		Thease see the abstract from page 2 to 5
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported
Dackground/rationale		Please see the introduction from page 4 to 5
Objectives	3	State specific objectives, including any prespecified hypotheses
		The introduction on page 5 reported:
		"This survey aimed to assess the clinical status of CSU in Italy from
		the perspective of specialists who treat CSU (dermatologists and
		allergy specialists) and patients who have the disease. Both the
		specialists' therapeutic approach and the patients' experiences were
		assessed, with a focus on potential barriers to diagnosis and
		treatment that patients with CSU in Italy may experience"
Mathada		
<u>Methods</u> Study design	4	Present key elements of study design early in the paper
Study design	4	Methods on pages 5 and 6 reported:
		"This multicenter Italian survey comprised two questionnaires, one
		for physicians and one for patients with CSU. Only data from patients
		and physicians who accepted to be interviewed were collected. The
		survey was designed by an independent market research company
		(Stethos Marketing Research, Milan, Italy) and was tested with pilot
		interviews to specialists. Survey results were also collected and
		analyzed by Stethos Marketing Research and stratified according to
		geographical area and hospital/center size. Due to the qualitative
		nature of these surveys, no inferential analyses were performed.
		The research was conducted in conformity with the Code of Conduct
		2014 of the European Pharmaceutical Market Research Association
		(EphMRA)."
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment,
Setting 5		exposure, follow-up, and data collection
		Methods on page 6 reported:
		Data were collected from a sample of physicians, specifically
		specialists in dermatology or allergy, to assess their diagnostic-
		therapeutic approach to CSU. Physicians and centers were selected
		from a proprietary database of Stethos Marketing Research. In order
		to obtain a good level of confidence, 320 physicians – 160
		<i>dermatologists and 160 allergy specialists – from across Italy who</i> <i>were directly involved in the diagnosis and treatment of CSU were</i>

### **BMJ Open**

# enrolled.

Physicians were asked to complete a survey exploring their approach to the management of CSU and also provided completed patient diaries. The survey, consisting of 28 questions, some of them with sub-questions (for a total of 37), was conducted online using a Computer-Assisted Web Interviewing (C.A.W.I.) platform (...). The specialists completed online Web Patient Diaries for the last five CSU patients examined during the study reference period. The objective was to collect at least 1000 patient diaries to allow for a robust dataset including information about the diagnosis, the previous and current treatments and the frequency of visits. This sample of interviewees was to be representative of the population of the CSU specialists in Italy, with a maximum margin of error of  $\pm 5.3$  and a 95% confidence interval (CI).

# Methods on page 7 reported:

The patient sample was targeted to ensure a good distribution by geographical area and size of the treating hospital. This was achieved by ranking the centers by the number of CSU patients being treated: the centers with the highest number of patients were selected. A random sample of patients with CSU being treated in each of these centers was asked to participate in the survey, before/after a routine assessment at the dermatology/allergy department. Planned enrolment was about 500 patients with CSU (an average of 4–5 patients from each center). This sample of respondents to the patient survey was to be representative of the population of patients with CSU in Italy (0.5–1% of the Italian population), with a maximum margin of error of  $\pm 4.2$  and a 95% CI.

The patient surveys were self-administered via a C.A.W.I. system platform, and comprised of 46 questions, some of them with subquestions (for a total of 50)

Participants

(*a*) Give the eligibility criteria, and the sources and methods of selection of participants

For physicians and patients' diaries Methods on page 6 reported: Data were collected from a sample of physicians, specifically specialists in dermatology or allergy, to assess their diagnostictherapeutic approach to CSU. Physicians and centers were selected from a proprietary database of Stethos Marketing Research. In order to obtain a good level of confidence, 320 physicians – 160 dermatologists and 160 allergy specialists – from across Italy who were directly involved in the diagnosis and treatment of CSU were enrolled.

# For patients Methods on page 7 reported:

The patient sample was targeted to ensure a good distribution by geographical area and size of the treating hospital. This was achieved by ranking the centers by the number of CSU patients being treated: the centers with the highest number of patients were selected. A random sample of patients with CSU being treated in each of these

		non-responders, specialists tended to favor treatment with an increased dose non-sedating antihistamine in combination with a LTRA and an H2-antihistamine, or an increased dose non-sedating antihistamine in combination with a steroid or cyclosporine, a regimen especially preferred in more severe disease. On page 19: For the specialists surveyed, the main goal of CSU treatment was ke symptom resolution (itching and hives) and few considered improvin QoL a priority. On page 20: () there was a gap in the knowledge of the specialists regarding th main scales used to assess disease activity, with only approximately half of the surveyed specialists acknowledging familiarity with the UAS and UAS7, and only one-sixth acknowledging familiarity with and utilized the CU-QoL questionnaire On page 20-21: In their efforts to obtain symptom relief, over a third of patients had on average consulted two previous physicians. Surprisingly, the number of specialists changed did not vary significantly when stratified by disease severity. The most common reason for switching providers was dissatisfaction with medical staff. On page 21: Furthermore, most patients did not have patient support services
Limitations	19	<i>available to them at their medical center.</i> Discuss limitations of the study, taking into account sources of potential bias or
		imprecision. Discuss both direction and magnitude of any potential bias
		On page 21:
		The limitations of the present study include those inherent in the
		survey/questionnaire format. Although the questionnaires were
		designed to minimize bias, there is always a subjective element remaining (e.g. respondents tend to avoid scoring at the end of scale
		and answer in a way they perceive to be desired by the investigator/
		more socially acceptable).
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations
		multiplicity of analyses, results from similar studies, and other relevant evidence
		On page 22:
		In general, patients in Italy with CSU are similar to patients with
		CSU in other countries. However, there are some gaps in the care of
		these patients resulting in treatment dissatisfaction and a decreased
		<i>QoL. These results should be used to improve the treatment of</i>
		patients with CSU in Italy, in particular by reinforcing the knowledg
		of the available tools, such as the UAS and CU-QoL questionnaires,
Conoralizability	21	which can be used to assist specialists in treating patients with CSU
Generalisability	21	Discuss the generalisability (external validity) of the study results On page 21:
		A strength of the study is that by selecting a representative sample of
		A strength of the study is that, by selecting a representative sample of both patients with CSU and of specialists involved in the treatment of

		condition from both perspectives
