Title:Feasibility and cross-cultural validation of an adapted social skills group training programme (KONTAKTTM CHILD) for Chinese autistic children: a wait-list RCT protocol

Online Supplemental File 3: Supplementary

information on the cost-effectiveness analysis of the

Chinese KONTAKTTM CHILD study

The healthcare perspective will be considered from the particular interest of service providers, 4 5 participants, and parents. The societal perspective will acquire the healthcare service costs, transportation fees to the healthcare services, additional education costs due to the child's diagnosis of autism, parents' 6 out-of-pocket costs (e.g., home accommodation due to the child's diagnosis of autism), parental and the 7 child's productivity losses due to autism, and unpaid caregiver time (additional hours of care provided to the 8 child) using the TIC-PC [1]. Productivity losses of the parents are divided into absenteeism and presenteeism [2, 3]. Absenteeism is quantified by multiplying the number of days off work due to the child's 10 health condition by the hours per workday of the parent. This will then be multiplied by the parent's salary. 11 12 The calculation of presenteeism productivity loss will apply this formula: number of impaired workday x [1] - (efficacy score/10)] x number of hours per workday, in which the efficacy score ranges from 0 (present at 13 work but no function at all) to 10 (bothered, but can function equally as a typical day) [1, 2, 3]. Unpaid 14 caregiver time will apply to the price paid for equal care time provided by a home care worker. For 15 16 prescription and non-prescription drugs, the unit costs are obtained from the Guangdong Provincial Bureau of Medicine website [4]. 17
